Preface

As far as you know, IELTS candidates will have only 60 minutes for this IELTS Reading part with a total of 40 questions. Therefore, it is absolutely necessary that you invest time in practicing the real IELTS reading tests for this module.

Besides Cambridge IELTS Practice Tests series published by Oxford University Press, IELTS Reading Recent Actual Tests with Answers aims to develop both test-taking skills and language proficiency to help you achieve a high IELTS Reading score. It contains IELTS Reading Tests in the chronological order starting from the recent tests and an Answer Key. Each test contains three reading passages which cover a rich variety of topics and give a lot of practice for a wide range of question types used in the IELTS Exam such as multiple-choice questions, short-answer questions, sentence completion, summary completion, classification, matching lists / phrases, matching paragraph headings, identification of information – True/False/Not Given, etc. When studying IELTS with this e-book, you can evaluate at the nearest possibility how difficult the IELTS Reading section is in the real exam, and what the top most common traps are. Moreover, these tests are extracted from authentic IELTS bank source; therefore, you are in all probability to take these tests in your real examinations.

The authors are convinced that you will find IELTS Reading Recent Actual Tests extremely helpful on your path to success with the International English Language Testing System.

Don't just trust luck in your IELTS exam – the key is practice!

SECTION 1

Passage 1

You should spend about 20 minutes on Questions 1-14 which are based on Reading Passage 1

Biology of Bitterness

To many people, grapefruit is palatable only when doused in sugar. Bitter Blockers like adenosine monophosphate could change that.

A.

There is a reason why grapefruit juice is served in little glasses: most people don't want to drink more than a few ounces at a time. Naringin, a natural chemical compound found in grapefruit, tastes bitter. Some people like that bitterness in small doses and believe it enhances the general flavor, but others would rather avoid it altogether. So juice packagers often select grapefruit with low naringin though the compound has antioxidant properties that some nutritionists contend may help prevent cancer and arteriosclerosis.

B.

It is possible, however, to get the goodness of grapefruit juice without the bitter taste. I found that out by participating in a test conducted at the Linguagen Corporation, a biotechnology company in Cranbury, New Jersey. Sets of two miniature white paper cups, labeled 304 and 305, were placed before five people seated around a conference table. Each of us drank from one cup and then the other, cleansing our palates between tastes with water and a soda cracker. Even the smallest sip of 304 had grapefruit's unmistakable bitter bite. But 305 was smoother; there was the sour taste of citrus but none of the bitterness of naringin. This juice had been treated with adenosine monophosphate, or AMP, a compound that blocks the bitterness in foods without making them less nutritious.

C.

Taste research is a booming business these days, with scientists delving into all five basics-sweet, bitter, sour, salty, and umami, the savory taste of protein. Bitterness is of special interest to industry because of its untapped potential in food. There are thousands of bitter-tasting compounds in nature. They defend plants by warning animals away and protect animals by letting them know when a plant may be poisonous. But the system isn't foolproof. Grapefruit and cruciferous vegetable like Brussels sprouts and kale are nutritious despite-and sometimes because of-their bitter-tasting components. Over time, many people have learned to love them, at least in small doses. "Humans are the only species that enjoys bitter taste," says Charles Zuker, a neuroscientist at the University of

California School of Medicine at San Diego. "Every other species is averse to bitter because it means bad news. But we have learned to enjoy it. We drink coffee, which is bitter, and quinine [in tonic water] too. We enjoy having that spice in our lives." Because bitterness can be pleasing in small quantities but repellent when intense, bitter blockers like AMP could make a whole range of foods, drinks, and medicines more palatable-and therefore more profitable.

D.

People have varying capacities for tasting bitterness, and the differences appear to be genetic. About 75 percent of people are sensitive to the taste of the bitter compounds phenylthiocarbamide and 6-n-propylthiouracil, and 25 percent are insensitive. Those who are sensitive to phenylthiocarbamide seem to be less likely than others to eat cruciferous vegetables, according to Stephen Wooding, a geneticist at the University of Utah. Some people, known as supertasters, are especially sensitive to 6-n-propylthiouracil because they have an unusually high number of taste buds. Supertasters tend to shun all kinds of bitter-tasting things, including vegetable, coffee, and dark chocolate. Perhaps as a result, they tend to be thin. They're also less fond of alcoholic drinks, which are often slightly bitter. Dewar's scotch, for instance, tastes somewhat sweet to most people. "But a supertaster tastes no sweetness at all, only bitterness," says Valerie Duffy, an associate professor of dietetics at the University of Connecticut at Storrs.

E.

In one recent study, Duffy found that supertasters consume alcoholic beverages, on average, only two to three times a week, compared with five or six times for the average nontasters. Each taste bud, which looks like an onion, consists of 50 to 100 elongated cells running from the top of the bud to the bottom. At the top is a little clump of receptors that capture the taste molecules, known as tastants, in food and drink. The receptors function much like those for sight and smell. Once a bitter signal has been received, it is relayed via proteins known as G proteins. The G protein involved in the perception of bitterness, sweetness, and umami was identified in the early 1990s by Linguagen's founder, Robert Margolskee, at Mount Sinai School of Medicine in New York City. Known as gustducin, the protein triggers a cascade of chemical reactions that lead to changes in ion concentrations within the cell. Ultimately, this delivers a signal to the brain that registers as bitter. "The signaling system is like a bucket brigade," Margolskee says. "It goes from the G protein to other proteins."

F.

In 2000 Zuker and others found some 30 different kinds of genes that code for bitter-taste receptors. "We knew the number would have to be large because there is such a large universe of bitter tastants," Zuker says. Yet no matter which tastant enters the mouth or which receptor it attaches to, bitter always tastes the same to us. The only variation derives from its intensity and the ways in which it can be flavored by the sense of smell. "Taste cells are like a light switch," Zuker says. "They are either on or off."

G.

Once they figured out the taste mechanism, scientists began to think of ways to interfere with it. They tried AMP, an organic compound found in breast milk and other substances, which is created as cells break down food. AMP has no bitterness of its own, but when put in foods, Margolskee and his colleagues discovered, it attaches to bitter-taste receptors. As effective as it is, AMP may not be able to dampen every type of bitter taste, because it probably doesn't attach to all 30 bitter-taste receptors. So Linguagen has scaled up the hunt for other bitter blockers with a technology called high-throughput screening. Researchers start by coaxing cells in culture to activate bitter-taste receptors. Then candidate substances, culled from chemical compound libraries, are dropped onto the receptors, and scientists look for evidence of a reaction.

H.

In time, some taste researchers believe, compounds like AMP will help make processed foods less unhealthy. Consider, for example, that a single cup of Campbell's chicken noodle soup contains 850 milligrams of sodium chloride, or table salt—more than a third of the recommended daily allowance. The salt masks the bitterness created by the high temperatures used in the canning process, which cause sugars and amino acids to react. Part of the salt could be replaced by another salt, potassium chloride, which tends to be scarce in some people's diets. Potassium chloride has a bitter aftertaste, but that could be eliminated with a dose of AMP. Bitter blockers could also be used in place of cherry or grape flavoring to take the harshness out of children's cough syrup, and they could dampen the bitterness of antihistamines, antibiotics, certain HIV drugs, and other medications.

I.

A number of foodmakers have already begun to experiment with AMP in their products, and other bitter blockers are being developed by rival firms such as Senomyx in La Jolla, California. In a few years, perhaps, after food companies have taken the bitterness from canned soup and TV dinners, they can set their sights on something more useful: a bitter blocker in a bottle that any of us can sprinkle on our brussels sprouts or stir into our grapefruit juice.

Questions 1-8

The reading Passage has seven paragraphs A-I.

Which paragraph contains the following information?

Write the correct letter A-I, in boxes 1-8 on your answer sheet.

1. Experiment on bitterness conducted
2. Look into the future application
3. Bitterness means different information for human and animals
4. Spread process of bitterness inside of body

5. How AMP blocks bitterness
6. Some bitterness blocker may help lower unhealthy impact
7. Bitterness introduced from a fruit
8. Genetic feature determines sensitivity

Question 9-12

Summary

Complete the following summary of the paragraphs of Reading Passage, using no more than two words from the Reading Passage for each answer.

Write your answers in boxes 9-12 on your answer sheet.

The reason why grapefruit tastes bitter is because a substance called __9____ contained in it. However, bitterness plays a significant role for plants. It gives a signal that certain plant is 10____. For human beings, different person carries various genetic abilities of tasting bitterness. According to a scientist at the University of Utah, 11____ have exceptionally plenty of 12____, which allows them to perceive bitter compounds.

Questions 13-14

Choose the correct letter, A, B, C or D.

Write your answers in boxes 13-14 on your answer sheet.

13 What is the main feature of AMP according to this passage?

- A. offset bitter flavour in food
- B. only exist in 304 cup
- C. tastes like citrus
- D. chemical reaction when meets biscuit

14 What is the main function of G protein?

- A. collecting taste molecule
- B. identifying different flavors elements
- C. resolving large molecules
- D. transmitting bitter signals to the brain

SECTION 2

You should spend about 20 minutes on Questions 15-26 which are based on Reading Passage 2

Franklin's Lost Expedition

A.

What could have resulted in the deaths of 129 men and officers aboard the ship in Franklin's lost expedition? The fate of the ship remains a topic of investigation, still intriguing to some international researchers of today. Sir John Franklin and his crew set sail from England in 1845 in search of the Northwest Passage, a sea route that was rumored to connect the continents of Europe and Asia. Two ships, HMS Erebus and HMS Terror, headed the expedition. Franklin's wife, Lady Jane Franklin, had become worried after three years without any communication from the expedition. She then persuaded the government to begin investigating. The sites of the three first search efforts were Lancaster Sound, the Bering Strait and over land beginning at the Mackenzie River.

B.

All of these searches, as well as others that followed were unsuccessful in discovering the fate of the crew. Lady Franklin began her own search in 1851, but about a year later, these searches led by McClure and Collinson and their crews also turned up missing. Collinson eventually found his way back to England, while McClure was found and returned back in 1854. That same year, searcher John Rae reported to the Admiralty that according to Inuit information and some discovered items, it seemed that Franklin and the crew had perished. In a desperate last attempt to survive, some may have even taken up cannibalism. Rae was given what would be about \$400,000 Canadian dollars today as a reward. Therefore, it appeared that Admiralty would not pursue any further search efforts.

C.

However, Lady Franklin did not give up there, and in 1857 she began commissioning another search with Leopold McClintock as its leader. It was McClintock who found many corpses on King William Island, along with a journal which outlined the journey of Franklin's two ships, Erebus and Terror. On May 1847, it seemed according to the journal that the ships were stuck in ice. Even so, there should have been enough food supplies onboard the ships to last three years. "All well," said the note. Another note from April 25, 1848 made the situation appear more dire. Apparently, the ships had remained stuck in ice for over a year, with several men abandoning the expedition within the days before.

D.

Researchers, scientists and historians have continued to ponder this mystery for over 160

years. What had happened which had caused the men to abandon ship, rather than wait for the ice to melt? The Northwest Passage is well-known for its harsh weather and constantly changing sea ice. To the west King William Island, particularly strong gusts of wind howl over layers of thick ice, formed over periods of hundreds of years. How long did the ice trap Franklin's two unfortunate ships so that they could not move?

E.

Investigators and researchers continue looking for answers to these questions regarding Franklin's lost expedition, attempting to explain what happened to the captain and his crew. From American explorer Charles Francis Hall in 1860-1863, to Frederick Schwatka in 1879, as well as the Canadian government's search in 1930 and William Gibson's search a year later, some hints were found in the form of human remains, Inuit information and discovered items, but no certain conclusions could be reached. In 1981, along the western coast of King William Island, the University of Alberta-led Franklin Expedition Forensic Anthropology Project dug up human remains. Forensic testing at the time suggested that the cause of death was likely either lead poisoning and scurvy. Lead poisoning has continued to persist as a possible explanation for the loss of the expedition since then. However, proving this is not so simple, as surgeons' journals (the "sick books") which recorded illness on board have yet to be found.

F.

Still without Franklin sick books, a team of researchers from the University of Glasgow took up a study of the sick books of Royal Naval ships which were searching for Franklin. The search ships were equipped similarly, with the same provisions as Franklin's vessels, therefore the team looked over the illnesses and fatalities within the search crews under the assumption that the conditions suffered by those crews could mirror those of the lost expedition.

G.

Due to relatively high levels of lead found in some remains of the crew, it has been suggested that lead poisoning from solder that sealed the expedition's canned provisions could explain the lost expedition. However, within the other search ships who had similar provisions, no evidence of lead poisoning was found, despite the relatively high exposure to lead that was unavoidable on ships of the era and within the overall British population. So, unless Franklin's ships had a particular lead source, there is no substantial proof that lead poisoning had a role in the failed expedition. Across nine search crews, patterns in illnesses led researchers to conclude that Franklin's men would have suffered the same respiratory and gastrointestinal disorders, injuries and exposure, and that some fatalities might have been a result of respiratory, cardiovascular and tubercular conditions. Moreover, the team suggested that the abnormally high number of deaths of Franklin's officers was probably a result of non-medical circumstances such as accidents and injuries that happened when officers accepted the risky responsibility of hunting animals to provide food, or walking over difficult terrain in a severe climate, continuing their attempts at finding the route of a Northwest Passage.

H.

It seems possible that the 2016 discovery by the Arctic Research Foundation made recently in the wreck of HMS Terror, along with a discovery two years before in 2014 of HMS Erebus by Parks Canada could finally allow access to some first-hand evidence of medical issues and other factors at play in the failed expedition. If any of the expedition's records in writing have been preserved on board, it's possible they could still be read if they were left in the right underwater conditions. If a 'sick book' has managed to survive aboard a ship, the events that led to the lost expedition may be revealed, allowing those speculating to finally get some closure on the matter.

Questions 15-21

Do the following statements agree with the information given in the reading passage? In boxes 15-21 on your answer sheet, write

TRUE if the statement agrees with the information

FALSE if the statement contradicts the information

NOT GIVEN if there is no information on this.

15. Franklin's lost expedition was a search party attempting to find Lady Jane Franklin

16. John Rae suspected that Franklin's lost expedition likely suffered from a food shortage aboard the ship

17. The leaders of the search parties commissioned by Lady Franklin returned to England after some time

18. It was common for people living Britain during the 19th century to be exposed to lead

19. Most of the crew aboard Franklin's lost expedition were trained to hunt wild animals

20. The most recent research from University of Glasgow suggests that some of leaders of the crew on the Franklin expedition died from lead poisoning.

21. The research into the wreck of HMS Terror may shed light on the mystery of the lost expedition.

Questions 22-26

Complete the sentences below.

Choose NO MORE THAN THREE WORDS from the passage for each answer.

Write your answers in 22-26 on your answer sheet.

The Northwest Passage is a route which connects (22) _____ by sea.

As a reward for seemingly having discovered the fate of the Franklin expedition, (23) _____ was given an amount that would equal hundreds of thousands of Canadian dollars today.

Forensic testing available in the 80's suggested that either (24)_____or lead poisoning led to the deaths of the crew in the Franklin expedition.

The (25)_____made by doctors aboard the ships in the Franklin expedition still have not been recovered.

Researchers have suggested that the leaders of Franklin's crew might not have been ill, but could have died from (26)_____as a result of their behaviours.

SECTION 3

You should spend about 20 minutes on Questions 27-40 which are based on Reading Passage 3

Owl Secrets

A.

It always appeared to fly in the face of logic. But now, the biological secrets that allow owls to rotate their heads without cutting off their blood supply have finally been unravelled. Scientists have discovered four major adaptations in owls designed to prevent injury when the animals rotate their overly large heads by up to 270 degrees.

B.

The study found that the birds' unique bone structures and vascular systems let them move with increased flexibility. Scientists at John Hopkins University School of Medicine in the US studied snowy, barred and great horned owls after their deaths from natural causes. They found that the vertebral artery enters the neck higher than in other birds, creating more slack. Unlike humans, owls were found to have small vessel connections between the carotid and vertebral arteries, allowing the blood to be exchanged between the two blood vessels. This creates an uninterrupted blood flow to the brain, even if one route is blocked during extreme neck rotation.

C.

The adaptation gives the birds a huge range of vision without having to move their bodies and arouse detection by prey. The lack of similar adaptations in humans could explain why humans are more vulnerable to neck injury, the experts concluded. When humans attempt sudden and violent twists of their neck they risk damaging the lining of their blood vessels, which can result in a fatal blockage or stroke. Study senior investigator Doctor Philippe Gailloud, said: 'Until now, brain imaging specialists like me who deal with human injuries caused by trauma to arteries in the head and neck have always been puzzled as to why rapid, twisting neck movements did not leave thousands of owls lying dead on the forest floor from stroke. 'The carotid and vertebral arteries in the neck of most animals - including owls and humans - are very fragile and highly susceptible to even minor tears of the vessel lining.'

D.

To solve the puzzle, the researchers studied the bone and blood vessel structures in the heads and necks of the birds. An injectable contrast dye was used to highlight the birds' blood vessels, which were then dissected, drawn and scanned to allow detailed analysis.

E.

The most striking finding came after researchers injected dye into the owls' arteries, mimicking blood flow, and manually turned the animals' heads. They found that when they turned the heads, the blood vessels below the jaw bone expanded as more dye entered, creating pools of blood capable of maintaining the energy supply to the brain and eyes. They showed that the big carotid arteries, instead of being on the side of the neck as in humans, are carried close to the centre of rotation just in front of the spine. As a consequence, these arteries experience much less twisting and turning. The potential for damage is therefore greatly reduced. This contrasted starkly with human anatomical ability, where arteries generally tend to get smaller and smaller, and do not balloon out as they branch out. This creates the risk of clotting after sudden neck movements such as whiplash.

F.

Researchers say these contractile blood reservoirs act as a trade-off, allowing birds to pool blood to meet the energy needs of their large brains and eyes, while they rotate their heads. The supporting vascular network, with its many interconnections and adaptations, helps minimise any interruption in blood flow. The study results demonstrate what physical properties are needed to allow such extreme head movements, and explain why injuries sustained from treatments that involve manipulating bones with the hands such as chiropractic therapy can have such serious consequences for humans. Dr Gailloud added: 'Our new study results show precisely what morphological adaptations are needed to handle such head gyrations and why humans are so vulnerable to bone injury from chiropractic therapy. Extreme manipulations of the human head are really dangerous because we lack so many of the vessel-protecting features seen in owls.'

G.

Medical illustrator Fabian de Kok-Mercado said: 'In humans, the vertebral artery really hugs the brains and eyes, while they rotate their heads. The supporting vascular network, with its many interconnections and adaptations, helps minimise any interruption in blood flow. The study results demonstrate what physical properties are needed to allow such extreme head movements, and explain why injuries sustained from treatments that involve manipulating bones with the hands such as chiropractic therapy can have such serious consequences for humans. Dr Gailloud added: 'Our new study results show precisely what morphological adaptations are needed to handle such head gyrations and why humans are hollow cavities in the neck. But this is not the case in owls, whose structures are specially adapted to allow for greater arterial flexibility and movement.' It is a powerful adaptive trait, but it is not unique. Plenty of birds have a similar ability to look behind them. Red tailed hawks for example are almost as flexible as their nocturnal cousins. 'There are lots of advantages to being able to look over your shoulder and see something coming - if you're trying to avoid predators or detect prey', he added.

Question 27-34

Complete the summary using the list of words and phrases **A-M** below.

Write the correct letter, A-M in boxes 27-34 on your answer sheet.

NB You may use any letter more than once.

How can owls rotate their heads by 27 270 degrees? The many small bones that make up the neck and spine enable them to achieve 28 movement. A research team has discovered that in 29 , their vascular network has adapted to make the rotation possible. Owls' carotid arteries are 30 the spine, at the centre of rotation. This means the arteries endure 31 strain when the head is turned. In addition, the vessels 32 their heads can expand, creating reservoirs of blood to supply the brain when the head is turned. And the cavities in the neck vertebrae, through which the vessels pass, are extremely 33 , giving the vessels space to move around when twisted. All this is necessary because their eyes can't move: owls can only look 34 ahead.

- A** flexible
- B** as much as
- C** at the base of
- D** in front of
- E** intense
- F** limited
- G** far less
- H** multiple
- I** in excess of
- J** to the side of
- K** various ways
- L** large
- M** straight

Questions 35-40

Complete each sentence with the correct ending, **A-H** below.

Write the correct letter, **A-H** in boxes 35-40 on your answer sheet.

- 35. The bone structure and circulatory system of owls has evolved in order to
- 36. Humans' arteries tend to
- 37. Scientists injected dye into the blood vessels of dead owls in order to
- 38. When humans attempt sudden twists of their neck they are more likely to
- 39. The back;up arteries of owls are designed to
- 40. Owls have a huge range of vision which enables them to

- A collect any excess blood created in the process of turning.
- B cope with their very large heads.
- C damage the lining of their blood vessels.
- D decrease in size.
- E make them lighter.

F mimic natural blood flow.

G offer a fresh supply of nutrients when blood vessels get closed off.

H avoid detection by predators or to find prey.

Reading Test 2

SECTION 1

You should spend about 20 minutes on Questions 1-14 which are based on Reading Passage 1

Synaesthesia

A

Imagine a page with a square box in the middle. The box is lined with rows of the number 5, repeated over and over. All of the 5s are identical in size, font and colour, and equally distributed across the box. There is, however, a trick: among those 5s, hiding in plain sight is a single, capital letter S. Almost the same in shape, it is impossible to spot without straining your eyes for a good few minutes. Unless that is, you are a grapheme – colour synaesthete – a person who sees each letter and number in different colours. With all the 5s painted in one colour and the rogue S painted in another, a grapheme – colour synaesthete will usually only need a split second to identify the latter.

B

Synaesthesia, loosely translated as “senses coming together” from the Greek words syn (“with”) and aesthesis (“sensation”), is an interesting neurological phenomenon that causes different senses to be combined. This might mean that words have a particular taste (for example, the word “door” might taste like bacon), or that certain smells produce a particular colour. It might also mean that each letter and number has its own personality- the letter A might be perky, the letter B might be shy and self-conscious, etc. Some synaesthetes might even experience other people’s sensations, for example feeling pain in their chest when they witness a film character gets shot. The possibilities are endless: even though synaesthesia is believed to affect less than 5% of the general population, at least 60 different combinations of senses have been reported so far. What all these sensory associations have in common is that they are all involuntary and impossible to repress and that they usually remain quite stable over time.

C

Synaesthesia was first documented in the early 19th century by German physician Georg Sachs, who dedicated two pages of his dissertation on his own experience with the condition. It wasn’t, however, until the mid-1990s that empirical research proved its existence when Professor Simon Baron-Cohen and his colleagues used fMRIs on six synaesthetes and discovered that the parts of the brain associated with vision were active during auditory stimulation, even though the subjects were blindfolded.

D

What makes synaesthesia a particularly interesting condition is that it isn’t an illness at

all. If anything, synaesthetes often report feeling sorry for the rest of the population, as they don't have the opportunity to experience the world in a multisensory fashion like they do. Very few drawbacks have been described, usually minimal: for instance, some words might have an unpleasant taste (imagine the word "hello" tasting like spoiled milk), while some synaesthetes find it distressing when they encounter people with names which don't reflect their personality (imagine meeting a very interesting person named "Lee", when the letter E has a dull or hideous colour for you-or vice versa). Overall, however, synaesthesia is widely considered more of a blessing than a curse and it is often linked to intelligence and creativity, with celebrities such as Lady Gaga and Pharrell Williams claiming to have it.

E

Another fascinating side of synaesthesia is the way it could potentially benefit future generations. In a 2013 study, Dr Witthof and Dr Winawer discovered that grapheme-colour synaesthetes who had never met each other before experienced strikingly similar pairings between graphemes and colours-pairings which were later traced back to a popular set of Fischer-Price magnets that ten out of eleven participants distinctly remembered possessing as children. This was particularly peculiar as synaesthesia is predominantly considered to be a hereditary condition, and the findings suggested that a synaesthete's environment might play a determining role in establishing synaesthetic associations. If that was true, researchers asked, then might it not be possible that synaesthesia can actually be taught?

F

As it turns out, the benefits of teaching synaesthesia would be tremendous. According to research conducted by Dr Clare Jonas at the University of East London, teaching people to create grapheme-colour associations the same way as a synaesthete may have the possibility to improve cognitive function and memory. As she put it, 'one possibility is guarding against cognitive decline in older people-using synaesthesia in the creation of mnemonics to remember things such as shopping lists.' To that end, researchers in the Netherlands have already begun developing a web browser plug-in that will change the colours of certain letters. Rothen and his colleagues corroborate the theory: in a paper published in 2011, they suggest that synaesthesia might be more than a hereditary condition, as the non-synaesthetic subjects of their study were able to mimic synaesthetic associations long after leaving the lab.

G

There is obviously still a long way to go before we can fully understand synaesthesia and what causes it. Once we do, however, it might not be too long before we find out how to teach non-synaesthetes how to imitate its symptoms in a way that induces the same benefits 4.4% of the world's population currently enjoy.

Questions 1-7

The reading passage has 7 paragraphs, A-G.

Which paragraph contains the following information?

Write the correct letter, A-G, in boxes 1-7 on your answer sheet.

1. some of the disadvantages related to synaesthesia
2. what scientists think about synaesthesia's real-life usefulness
3. a prediction for the future of synaesthesia
4. an example of how grapheme-colour synaesthesia works
5. a brief history of synaesthesia
6. some of the various different types of synaesthesia
7. information about a study that suggests synaesthetic symptoms aren't arbitrary

Questions 8-11

Do the following statements agree with the information given in Reading Passage 1?
In boxes 8-11 on your answer sheet, write

TRUE if the statement is true according to the passage
FALSE if the statement is false according to the passage
NOT GIVEN if the information is not given in the passage

8. There are 60 different types of synaesthesia.
9. Before Professor Simon Baron-Cohen's research, synaesthesia was thought to be a myth.
10. A lot of celebrities are affected by synaesthesia.
11. Most scientists believe that synaesthesia runs in families.

Questions 12-13

Complete the summary.

Choose ONE WORD ONLY from the passage for each answer.

Write your answers in boxes 12-14 on your answer sheet

Synaesthesia is a unique neurological condition that causes different senses to get mixed. Recent research has suggested that teaching synaesthesia to non-synaesthetes can enhance 12 and guard against the deterioration of cognitive 13.....

SECTION 2

You should spend about 20 minutes on Questions 14-26, which are based on Reading Passage 2 below.

The History of pencil

A.

The beginning of the story of pencils started with a lightning. Graphite, the main material for producing pencil, was discovered in 1564 in Boirowdale in England when a lightning struck a local tree during a thunder. Local people found out that the black substance spotted at the root of the unlucky tree was different from burning ash of wood. It was soft, thus left marks everywhere. Chemistry was barely out of its infancy at the time, so people mistook it for lead, equally black but much heavier. It was soon put to use by locals in marking their sheep for signs of ownership and calculation.

B.

Britain turns out to be the major country where mines of graphite can be detected and developed. Even so, the first pencil was invented elsewhere. As graphite is soft, it requires some form of encasement. In Italy, graphite sticks were initially wrapped in string or sheepskin for stability, becoming perhaps the very first pencil in the world. Then around 1560, an Italian couple made what are likely the first blueprints for the modern, wood-encased carpentry pencil. Their version was a flat, oval, more compact type of pencil. Their concept involved the hollowing out of a stick of juniper wood. Shortly thereafter in 1662, a superior technique was discovered by German people: two wooden halves were carved, a graphite stick inserted, and the halves then glued together – essentially the same method in use to this day. The news of usefulness of these early pencils spread far and wide, attracting the attention of artists all over the known world.

C.

Although graphite core in pencils is still referred to as lead, modern pencils do not contain lead as the “lead” of the pencil is actually a mix of finely ground graphite and clay powders. This mixture is important because the amount of clay content added to the graphite depends on intended pencil hardness, and the amount of time spent on grinding the mixture determines the quality of the lead. The more clay you put in, the higher hardness the core has. Many pencils across the world, and almost all in Europe, are graded on the European system. This system of naming used B for black and H for hard; a pencil’s grade was described by a sequence or successive Hs or Bs such as BB and BBB for successively softer leads, and HH and HHH for successively harder ones. Then the standard writing pencil is graded HB.

D.

In England, pencils continued to be made from whole sawn graphite. But with the mass

production of pencils, they are getting drastically more popular in many countries with each passing decade. As demands rise, appetite for graphite soars. According to the United States Geological Survey (USGS), world production of natural graphite in 2012 was 1,100,000 tonnes, of which the following major exporters are: China, India, Brazil, North Korea and Canada.

When the value of graphite was realised, the mines were taken over by the government and guarded. One of its chief uses during the reign of Elizabeth I in the second half of the 16th century was as moulds for the manufacture of cannon balls. Graphite was transported from Keswick to London in armed stagecoaches. In 1751 an Act of Parliament was passed making it an offence to steal or receive “wad”. This crime was punishable by hard labour or transportation.

E.

That the United States did not use pencils in the outer space till they spent \$1000 to make a pencil to use in zero gravity conditions is in fact a fiction. It is widely known that astronauts in Russia used grease pencils, which don't have breakage problems. But it is also a fact that their counterparts in the United States used pencils in the outer space before real zero gravity pencil was invented. They preferred mechanical pencils, which produced fine lines, much clearer than the smudgy lines left by the grease pencils that Russians favoured. But the lead tips of these mechanical pencils broke often. That bit of graphite floating around the space capsule could get into someone's eye, or even find its way into machinery or electronics short or other problems. But despite the fact that the Americans did invent zero gravity pencil later, they stuck to mechanical pencils for many years.

F.

Against the backdrop of a digitalized world, the prospect of pencils seems bleak. In reality, it does not. The application of pencils has by now become so widespread that they can be seen everywhere, such as classrooms, meeting rooms and art rooms, etc. A spectrum of users are likely to continue to use it into the future: students to do math works, artists to draw on sketch pads, waiters or waitresses to mark on order boards, make-up professionals to apply to faces, and architects to produce blue prints. The possibilities seem limitless.

Questions 14-19

Complete the sentences below.

Choose ONE WORD ONLY from the passage for each answer.

Write your answers in boxes 14-19 on your answer sheet

Graphite was found under a 14 _____ in Borrowdale

Ancient people used graphite to sign possession and number of 15_____.

The first pencil was graphite wrapped in 16_____or animal skin.

In the eighteenth century, the 17_____protect the mines when the value of graphite was realized.

During the reign of Elizabeth I, people was condemnable if they 18_____or receive the “wad”.

Russian astronauts preferred 19_____pencils to write in the outer space.

Questions 20-26

Do the following statements agree with the information given in Reading Passage 2?
In boxes 20-26 on your answer sheet write

TRUE if the statement agrees with the information
FALSE if the statement contradicts the information
NOT GIVEN if there is no information on this

20. Italy is probably the first country of the whole world to make pencils.
21. Germany used various kinds of wood to make pencils.
22. Graphite makes a pencil harder and sharper.
23. Pencils are not produced any more since the reign of Elizabeth
24. Pencil was used during the first American space expedition. ‘
25. American astronauts did not replace mechanical pencils immediately after the zero gravity pencils were invented.
26. Pencils are unlikely to be used in the future.

SECTION 3

You should spend about 20 minutes on Questions 27-40, which are based on Reading Passage 3 below.

Stealth Forces in Weight Loss

The field of weight loss is like the ancient fable about the blind men and the elephant. Each man investigates a different part of the animal and reports back, only to discover their findings are bafflingly incompatible.

A.

The various findings by public-health experts, physicians, psychologists, geneticists, molecular biologists, and nutritionists are about as similar as an elephant's tusk is to its tail. Some say obesity is largely predetermined by our genes and biology; others attribute it to an overabundance of fries, soda, and screen-sucking; still others think we're fat because of viral infection, insulin, or the metabolic conditions we encountered in the womb. "Everyone subscribes to their own little theory," says Robert Berkowitz, medical director of the Center for Weight and Eating Disorders at the University of Pennsylvania School of Medicine. We're programmed to hang onto the fat we have, and some people are predisposed to create and carry more fat than others. Diet and exercise help, but in the end the solution will inevitably be more complicated than pushing away the plate and going for a walk. "It's not as simple as 'You're fat because you're lazy' says Nikhil Dhurandhar, an associate professor at Pennington Biomedical Research Center in Baton Rouge. "Willpower is not a prerogative of thin people. It's distributed equally."

B.

Science may still be years away from giving us a miracle formula for fat-loss. Hormone leptin is a crucial player in the brain's weight-management circuitry. Some people produce too little leptin; others become desensitized to it. And when obese people lose weight, their leptin levels plummet along with their metabolism. The body becomes more efficient at using fuel and conserving fat, which makes it tough to keep the weight off. Obese dieters' bodies go into a state of chronic hunger, a feeling Rudolph Leibel, an obesity researcher at Columbia University, compares to thirst. "Some people might be able to tolerate chronic thirst, but the majority couldn't stand it", says Leibel. "Is that a behavioural problem – a lack of willpower? I don't think so."

C.

The government has long espoused moderate daily exercise – of the evening-walk or take-the-stairs variety – but that may not do much to budge the needle on the scale. A 150-pound person burns only 150 calories on a half-hour walk, the equivalent of two apples. It's good for the heart, less so for the gut. "Radical changes are necessary," says Deirdre Barrett, a psychologist at Harvard Medical School and author of *Waistland*. "People don't lose weight by choosing the small fries or taking a little walk every other

day.” Barrett suggests taking a cue from the members of the Nation Weight Control Registry (NWCR), a self-selected group of more than 5,000 successful weight-losers who have shed diets an average 66 pounds and kept it off 5.5 years. Some registry members lost weight using low-carb diets; some went low-fat; other eliminated refined foods. Some did it on their own; others relied on counselling. That said, not everyone can lose 66 pounds and not everyone needs to. The goal shouldn’t be getting thin, but getting healthy. It’s enough to whittle your weight down to the low end of your set range, says Jeffrey Friedman, a geneticist at Rockefeller University. Losing even 10 pounds vastly decreases your risk of diabetes, heart disease, and high blood pressure. The point is to not give up just because you don’t look like a swimsuit model.

D.

The negotiation between your genes and the environment begins on day one. Your optimal weight, writ by genes, appears to get edited early on by conditions even before birth, inside the womb. If a woman has high blood-sugar levels while she’s pregnant, her children are more likely to be overweight or obese, according to a study of almost 10,000 mother-child pairs. Maternal diabetes may influence a child’s obesity risk through a process called metabolic imprinting, says Teresa Hillier, an endocrinologist with Kaiser Permanente’s Center for Health Research and the study’s lead author. The implication is clear: Weight may be established very early on, and obesity largely passed from mother to child. Numerous studies in both animals and humans have shown that a mother’s obesity directly increases her child’s risk for weight gain. The best advice for moms-to-be: Get fit before you get pregnant. You’ll reduce your risk of complications during pregnancy and increase your chances of having a normal-weight child.

E.

It’s the \$64,000 question: Which diets work? It got people wondering: Isn’t there a better way to diet? A study seemed to offer an answer. The paper compared two groups of adults: those who, after eating, secreted high levels of insulin, a hormone that sweeps blood sugar out of the bloodstream and promotes its storage as fat, and those who secreted less. Within each group, half were put on a low-fat diet and half on a low-glycemic-load diet. On average, the low-insulin-secreting group fared the same on both diets, losing nearly 10 pounds in the first six months — but they gained about half of it back by the end of the 18-month study. The high-insulin group didn’t do as well on the low-fat plan, losing about 4.5 pounds, and gaining back more than half by the end. But the most successful were the high-insulin-secretors on the low-glycemic-load diet. They lost nearly 13 pounds and kept it off.

F.

What if your fat is caused not by diet or genes, but by germs — say, a virus? It sounds like a sci-fi horror movie, but research suggests some dimension of the obesity epidemic may be attributable to infection by common viruses, says Dhurandhar. The idea of “infectobesity” came to him 20 years ago when he was a young doctor treating obesity in

Bombay. He discovered that a local avian virus, SMAM-1, caused chickens to die, sickened with organ damage but also, strangely, with lots of abdominal fat. In experiments, Dhurandhar found that SMAM-1 -infected chickens became obese on the same diet as uninfected ones, which stayed svelte.

G.

He later moved to the U.S. and onto a bona fide human virus, adenovirus 36 (AD-36). In the lab, every species of animal Dhurandhar infected with the virus became obese — chickens got fat, mice got fat, even rhesus monkeys at the zoo that picked up the virus from the environment suddenly gained 15 percent of their body weight upon exposure. In his latest studies, Dhurandhar has isolated a gene that, when blocked from expressing itself, seems to turn off the virus's fattening power. Stem cells extracted from fat cells and then exposed to AD-36 reliably blossom into fat cells — but when stem cells are exposed to an AD-36 virus with the key gene inhibited, the stem cells don't differentiate. The gene appears to be necessary and sufficient to trigger AD-36-related obesity, and the goal is to use the research to create a sort of obesity vaccine.

Questions 27-31

Reading Passage 3 has seven paragraphs, A-G.

Which paragraph contains the following information ?

Write the Correct letter, A-G, in boxes 27-31 on your answer sheet.

NB You may use any letter more than once

27. evaluation on the effect of weight loss on different kinds of diets
28. an example of a research which includes the relatives of the participants
29. an example of a group of people who did not regain weight immediately after weight loss
30. long-term hunger may appear to be acceptable to some of the participants during the period of losing weight program
31. a continuous experiment may lead to a practical application besides diet or hereditary resort

Questions 32-36

Look at the following findings (Question 32-36) and the list of researchers below.

Match each finding with the correct researcher, A-F

Write the correct letter, A-F, in boxes 32-36 on your answer sheet.

NB You may use any letter more than once

32. A person's weight is determined by the interaction of his/her DNA and the environment.
33. Pregnant mothers who are overweight may risk their fetus in gaining weight.
34. The aim of losing weight should be keeping healthy rather than being attractive.
35. Small changes in lifestyle will not help in reducing much weight.
36. Researchers can be divided into different groups with their own point of view about weight loss.

List of Researchers

- A. Robert Berkowitz.
- B. Rudolph Leibel.
- C. Nikhil Dhurandhar.
- D. Deirdre Barret.
- E. Jeffrey Friedman.
- F. Teresa Hillier.

Questions 37-40

Complete the sentences below

Choose ONE WORD AND/OR A NUMBER from the passage for each answer.

Write your answers in boxes 37-40 on your answer sheet.

In Bombay Clinic, a young doctor who came up with the concept 'infectobesity' believed that the obesity is caused by a kind of virus. For years, he conducted experiments on 37_____. Finally, later as he moved to America, he identified a new virus named 38_____ which proved to be a significant breakthrough in inducing more weight. Although there seems no way to eliminate the virus till now, a kind of 39_____ can be separated as to block the effectiveness of the virus. In the future, the doctor is aiming at developing a new 40_____ which might effectively combat against the virus.

Reading Test 3

SECTION 1

You should spend about 20 minutes on Questions 1-14 which are based on Reading Passage 1

Australian culture and culture shock

A.

Sometimes work, study or a sense of adventure take us out of our familiar surroundings to go and live in a different culture. The experience can be difficult, even shocking.

B.

Almost everyone who studies, lives or works abroad has problems adjusting to a new culture. This response is commonly referred to as 'culture shock'. Culture shock can be defined as 'the physical and emotional discomfort a person experiences when entering a culture different from their own' (Weaver, 1993).

C.

For people moving to Australia, Price (2001) has identified certain values which may give rise to culture shock. Firstly, he argues that Australians place a high value on independence and personal choice. This means that a teacher or course tutor will not tell students what to do, but will give them a number of options and suggest they work out which one is the best in their circumstances. It also means that they are expected to take action if something goes wrong and seek out resources and support for themselves.

D.

Australians are also prepared to accept a range of opinions rather than believing there is one truth. This means that in an educational setting, students will be expected to form their own opinions and defend the reasons for that point of view and the evidence for it.

E.

Price also comments that Australians are uncomfortable with differences in status and hence idealise the idea of treating everyone equally. An illustration of this is that most adult Australians call each other by their first names. This concern with equality means that Australians are uncomfortable taking anything too seriously and are even ready to joke about themselves.

F.

Australians believe that life should have a balance between work and leisure time. As a consequence, some students may be critical of others who they perceive as doing nothing but study.

G.

Australian notions of privacy mean that areas such as financial matters, appearance and relationships are only discussed with close friends. While people may volunteer such information, they may resent someone actually asking them unless the friendship is firmly established. Even then, it is considered very impolite to ask someone what they earn. With older people, it is also rude to ask how old they are, why they are not married or why they do not have children. It is also impolite to ask people how much they have paid for something, unless there is a very good reason for asking.

H.

Kohls (1996) describes culture shock as a process of change marked by four basic stages. During the first stage, the new arrival is excited to be in a new place, so this is often referred to as the "honeymoon" stage. Like a tourist, they are intrigued by all the new sights and sounds, new smells and tastes of their surroundings. They may have some problems, but usually they accept them as just part of the novelty. At this point, it is the similarities that stand out, and it seems to the newcomer that people everywhere and their way of life are very much alike. This period of euphoria may last from a couple of weeks to a month, but the letdown is inevitable.

I.

During the second stage, known as the 'rejection' stage, the newcomer starts to experience difficulties due to the differences between the new culture and the way they were accustomed to living. The initial enthusiasm turns into irritation, frustration, anger and depression, and these feelings may have the effect of people rejecting the new culture so that they notice only the things that cause them trouble, which they then complain about. In addition, they may feel homesick, bored, withdrawn and irritable during this period as well.

J.

Fortunately, most people gradually learn to adapt to the new culture and move on to the third stage, known as 'adjustment and reorientation'. During this stage a transition occurs to a new optimistic attitude. As the newcomer begins to understand more of the new culture, they are able to interpret some of the subtle cultural clues which passed by unnoticed earlier. Now things make more sense and the culture seems more familiar. As a result, they begin to develop problem-solving skills, and feelings of disorientation and anxiety no longer affect them.

K.

In Kohls's model, in the fourth stage, newcomers undergo a process of adaptation. They have settled into the new culture, and this results in a feeling of direction and self-confidence. They have accepted the new food, drinks, habits and customs and may even find themselves enjoying some of the very customs that bothered them so much previously. In addition, they realise that the new culture has good and bad things to offer and that no way is really better than another, just different.

Questions 1-6

Do the following statements agree with the information given in the reading passage?

Write

TRUE if the statement agrees with the information

FALSE if the statement contradicts the information

NOT GIVEN if there is no information on this

1. Australian teachers will suggest alternatives to students rather than offer one solution.
2. In Australia, teachers will show interest in students' personal circumstances.
3. Australians use people's first names so that everyone feels their status is similar.
4. Students who study all the time may receive positive comments from their colleagues.
5. It is acceptable to discuss financial issues with people you do not know well.
6. Younger Australians tend to be friendlier than older Australians.

Questions 7-13

Complete the table below.

Choose **NO MORE THAN TWO WORDS** from the passage for each answer.

THE STAGES OF CULTURE SHOCK

	Name	Newcomers' reaction to problems
Stage 1	7 _____	They notice the 8 _____ between different nationalities and cultures. They may experience this stage for up to 9 _____
Stage 2	Rejection	They reject the new culture and lose the 10 _____ they had at the beginning.
Stage 3	Adjustment and reorientation	They can understand some 11 _____ which they had not previously observed. They learn 12 _____ for dealing with difficulties.
Stage 4	13 _____	They enjoy some of the customs that annoyed them before.

SECTION 2

You should spend about 20 minutes on Questions 14-26, which are based on Reading Passage 2 below.

Hunting Perfume in Madagascar

A.

Ever since the *unguentari* plied their trade in ancient Rome, perfumers have to keep abreast of changing fashions. These days they have several thousand ingredients to choose from when creating new scents, but there is always demand for new combinations. The bigger the “palette” of smells, the better the perfumer’s chance of creating something fresh and appealing. Even with everyday products such as shampoo and soap, kitchen cleaners and washing powders, consumers are becoming increasingly fussy. And many of today’s fragrances have to survive tougher treatment than ever before, resisting the destructive power of bleach or a high temperature wash cycle. Chemists can create new smells from synthetic molecules, and a growing number of the odours on the perfumer’s palette are artificial. But nature has been in the business far longer.

B.

The island of Madagascar is an evolutionary hot spot; 85% of its plants are unique, making it an ideal source for novel fragrances. Last October, Quest International, a company that develops fragrances for everything from the most delicate perfumes to cleaning products, sent an expedition to Madagascar in pursuit of some of nature’s most novel fragrances. With some simple technology, borrowed from the pollution monitoring industry, and a fair amount of ingenuity, the perfume hunters bagged 20 promising new aromas in the Madagascan rainforest. Each day the team set out from their “hotel”—a wooden hut lit by kerosene lamps, and trailed up and down paths and animal tracks, exploring the thick vegetation up to 10 meters on either side of the trail. Some smells came from obvious places, often big showy flowers within easy reach. Others were harder to pin down. “Often it was the very small flowers that were much more interesting, says Clery. After the luxuriance of the rainforest, the little-known island of Nosy Hara was a stark, dry place geologically and biologically very different from the mainland, “Apart from two beaches, the rest of the Island is impenetrable, except by hacking through the bush, says Clery. One of the biggest prizes here was a sweet-smelling sap weeping from the gnarled branches of some ancient shrubby trees in the parched Interior. So far no one has been able to identify the plant.

C.

With most flowers or fruits, the hunters used a technique originally designed to trap and identify air pollutants. The technique itself is relatively simple. A glass bell jar or flask is fitted over the flower. The fragrance molecules are trapped in this “headspace” and can be extracted by pumping the air out over a series of filters which absorb different types of

volatile molecules. Back home in the laboratory, the molecules are flushed out of the filters and injected into a gas chromatograph for analysis. If it is impossible to attach the headspace gear, hunters fix an absorbent probe close to the source of the smell. The probe looks something like a hypodermic syringe, except that the 'needle' is made of silicone rubber which soaks up molecules from the air. After a few hours, the hunters retract the rubber needle and seal the tube, keeping the odour molecules inside until they can be injected into the gas chromatograph in the laboratory.

D.

Some of the most promising fragrances were those given, off by resins that oozed from the bark of trees. Resins are the source of many traditional perfumes, including frankincense and myrrh. The most exciting resin came from a Calophyllum tree, which produces a strongly scented medicinal oil. The sap of this Calophyllum smelt rich and aromatic, a little like church incense. But it also smelt of something the fragrance industry has learnt to live without castoreum a substance extracted from the musk glands of beavers and once a key ingredient in many perfumes. The company does not use animal products any longer, but it was wonderful to find a tree with an animal smell.

E.

The group also set out from the island to capture the smell of coral reefs. Odors that conjure up sun-kissed seas are highly sought after by the perfume industry. "From the ocean, the only thing we have is seaweed, and that has a dark and heavy aroma. We hope to find something unique among the corals," says Dir. The challenge for the hunters was to extract a smell from water rather than air. This was an opportunity to try Clery's new "aquaspace" apparatus a set of filters that work underwater. On Nosy Hara, jars were fixed over knobs of coral about 2 meters down and water pumped out over the absorbent filters. So what does coral smell like? "It's a bit like lobster and crab," says Clery. The team's task now is to recreate the best of then captured smells. First they must identify the molecules that make up each fragrance. Some ingredients may be quite common chemicals. But some may be completely novel, or they may be too complex or expensive to make in the lab. The challenge then is to conjure up the fragrances with more readily available materials. "We can avoid the need to import plants from the rainforest by creating the smell with a different set of chemicals from those in the original material," says Clery. "If we get it right, you can sniff the sample and it will transport you straight back to the moment you smelt it in the rainforest."

Questions 14-19

The reading passage has seven paragraphs A-E

Which paragraphs contain the following details: Write the correct number, A-E, in boxes 14-18 on your answer sheet.

NB You may use any letter more than once.

14. One currently preferred spot to pick up plants for novel finding
15. A new task seems to be promising yet producing limited finding in fragrance source
16. The demanding conditions for fragrance to endure.

- 17. A substitute for substance no longer available to the perfume manufacture
- 18. Description of an outdoor expedition on land chasing new fragrances.

Questions 19-23

Do the following statements agree with the information given in Reading Passage 2? In boxes 19-23 on your answer sheet, write

TRUE if the statement is true

FALSE if the statement is false

NOT GIVEN if the information is not given in the passage 2

- 19. Manufacturers can choose to use synthetic odours for the perfume nowadays.
- 20. Madagascar is chosen to be a place for hunting plants which are rare in other parts of the world.
- 21. Capturing the smell is one of the most important things for creating new aromas.
- 22. The technique the hunters used to trap fragrance molecules is totally out of their ; ingenuity.
- 23. Most customers prefer the perfume made of substance extracted from the musk glands of animals.

Questions 24-26

Filling the blanks and answering the questions below with only one word.

A simple device used to trap molecules

SECTION 3

You should spend about 20 minutes on Questions 27-40, which are based on Reading Passage 3 below.

SLEEP WHY WE SLEEP

As the field of sleep research is still relatively new, scientists have yet to determine exactly why people sleep. However, they do know that humans must sleep and, in fact, people can survive longer without food than without sleep. And people are not alone in this need. All mammals, reptiles and birds sleep.

Scientists have proposed the following theories on why humans require sleep:

- Sleep may be a way of recharging the brain. The brain has a chance to shut down and repair neurons and to exercise important neuronal connections that might otherwise deteriorate due to lack of activity.
- Sleep gives the brain an opportunity to reorganise data to help find a solution to problems, process newly-learned information and organise and archive memories.
- Sleep lowers a person's metabolic rate and energy consumption.
- The cardiovascular system also gets a break during sleep. Researchers have found that people with normal or high blood pressure experience a 20 to 30% reduction in blood pressure and 10 to 20% reduction in heart rate.
- During sleep, the body has a chance to replace chemicals and repair muscles, other tissues and aging or dead cells.
- In children and teenagers, growth hormones are released during deep sleep.

When a person falls asleep and wakes up is largely determined by his or her circadian rhythm, a day-night cycle of about 24 hours. Circadian rhythms greatly influence the timing, amount and quality of sleep.

For many small mammals such as rodents, sleep has other particular benefits, as it provides the only real opportunity for physical rest, and confines the animal to the thermal insulation of a nest. In these respects, sleep conserves much energy in such mammals, particularly as sleep can also develop into a torpor, whereby the metabolic rate drops significantly for a few hours during the sleep period. On the other hand, humans can usually rest and relax quite adequately during wakefulness, and there is only a modest further energy saving to be gained by sleeping. We do not enter torpor, and the fall in metabolic rate for a human adult sleeping compared to lying resting but awake is only about 5-10%.

A sizeable portion of the workforce is shift workers who work and sleep against their bodies' natural sleep-wake cycle. While a person's circadian rhythm cannot be ignored or reprogrammed, the cycle can be altered by the timing of things such as naps, exercise, bedtime, travel to a different time zone and exposure to light. The more stable and consistent the cycle is, the better the person sleeps. Disruption of circadian rhythms has even been found to cause mania in people with bipolar disorder.

The 'seven deadly sins' formulated by the medieval monks included Sloth. The Bible in Proverbs 6:9 includes the line: 'How long will you sleep, O sluggard? When will you arise out of your sleep?' But a more nuanced understanding of sloth sees it as a disinclination to labour or work. This isn't the same as the desire for healthy sleep. On the contrary, a person can't do work without rest periods and no one can operate at top performance without adequate sleep. The puritan work ethic can be adhered to and respect still paid to the sleep needs of healthy humans. It is wrong to see sleep as a shameful activity.

Usually, sleepers pass through five stages: 1, 2, 3, 4 and REM (rapid eye movement) sleep. These stages progress cyclically from 1 through REM then begin again. A complete sleep cycle takes an average of 90 to 110 minutes. The first sleep cycles each night have relatively short REM sleeps and long periods of deep sleep but later in the night, REM periods lengthen and deep sleep time decreases. Stage 1 is light sleep where you drift in and out of sleep and can be awakened easily. In this stage, the eyes move slowly and muscle activity slows. During this stage, many people experience sudden muscle contractions preceded by a sensation of falling. In stage 2, eye movement stops and brain waves become slower with only an occasional burst of rapid brain waves. When a person enters stage 3, extremely slow brain waves called delta waves are interspersed with smaller, faster waves. In stage 4, the brain produces delta waves almost exclusively. Stages 3 and 4 are referred to as deep sleep, and it is very difficult to wake someone from them. In deep sleep, there is no eye movement or muscle activity. This is when some children experience bedwetting, sleepwalking or night terrors.

In the REM period, breathing becomes more rapid, irregular and shallow, eyes jerk rapidly and limb muscles are temporarily paralysed. Brain waves during this stage increase to levels experienced when a person is awake. Also, heart rate increases, blood pressure rises and the body loses some of the ability to regulate its temperature. This is the time when most dreams occur, and, if awoken during REM sleep, a person can remember their dreams. Most people experience three to five intervals of REM sleep each night. Infants spend almost 50% of their time in REM sleep. Adults spend nearly half of sleep time in stage 2, about 20% in REM and the other 30% is divided between the other three stages. Older adults spend progressively less time in REM sleep.

As sleep research is still a relatively young field, scientists did not discover REM sleep until 1953, when new machines were developed to monitor brain activity. Before this discovery, it was believed that most brain activities ceased during sleep. Since then, scientists have also disproved the idea that deprivation of REM sleep can lead to insanity and have found that lack of REM sleep can alleviate clinical depression although they do not know why. Recent theories link REM sleep to learning and memory.

Questions 27-30

Choose the correct letter, A, B, C or D.

27. Among other functions, sleep serves to

A. help the adult body develop physically.

- B. push daily problems from our minds.
- C. accelerate the learning process significantly.
- D. re-energise parts of the brain.

28. 'Torpor' can be described as

- A. a very deep sleep.
- B. a long state of hibernation.
- C. the sleep all non-human mammals experience.
- D. a light sleep

29. Unlike small mammals, humans

- A. don't sleep to conserve energy.
- B. don't sleep properly.
- C. save only a small amount of energy by sleeping.
- D. show no decrease in their metabolic rate when they sleep.

30. In stage 3 deep sleep

- A. the eyes move slowly and there's little muscle activity.
- B. there is an alternation of delta waves and small fast waves.
- C. there is an occasional burst of rapid brain waves.
- D. there are no small fast waves.

Questions 31-35

Complete the flow-chart below.

Write **NO MORE THAN THREE WORDS** for each answer.

The Stages of Sleep

The individual drifts in and out of consciousness and can be woken up easily as they are only in a 31..... Eye movement is slow and there is reduced muscle activity.

The speed of 32..... activity slows and all movement of the eyes tends to stop.

Brain activity is dominated by delta waves, with a scattering of 33..... also in evidence.

In a state of 34....., the brain emits delta waves almost exclusively. It is hard to wake the individual.

A period of rapid eye movement follows, during which 35..... patterns are not consistent and limb muscles enter a temporary state of paralysis.

Questions 36-40

Complete the summary.

Choose **NO MORE THAN TWO WORDS** from the passage for each answer.

Sleep is so essential to a person that he can actually go longer without food than without sleep. During sleep, the brain has the chance to close down and do some repair work on neuronal connections which could otherwise 36..... in a state of inactivity. Sleep also gives the brain the opportunity to organise data, especially newly-learned information.

During this rest period, the 37..... Drops and energy consumption goes down. At the same time, the cardiovascular system has a much-needed rest. While they go into a deep sleep, humans don't fall into 38....., unlike some small animals such as rodents. A 39..... of 24 hours is described as a person's 40....., and this greatly influences a person's amount of sleep, and the type of sleep he gets.

Reading Test 4

SECTION 1

You should spend about 20 minutes on Questions 1-13 which are based on Reading Passage 1

Pollution in the Bay

A.

Pouring water into the sea sounds harmless enough. But in Florida Bay, a large and shallow section of the Gulf of Mexico that lies between the southern end of the Everglades and the Florida Keys, it is proving highly controversial. That is because researchers are divided over whether it will help or hinder the plants and animals that live in the bay.

B.

What is at risk is the future of the bay's extensive beds of seagrasses. These grow on the bay's muddy floor and act as nurseries for the larvae of shrimps, lobsters and fish – many of the important sport and commercial-fishing species. Also in danger is an impressive range of coral reefs that run the length of the Florida Keys and form the third-largest barrier reef in the world. Since the 1980s, coral cover has dropped by 40%, and a third of the coral species have gone. This has had a damaging effect on the animals that depend on the reef, such as crabs, turtles and nearly 600 species of fish.

C.

What is causing such ecological change is a matter of much debate. And the answer is of no small consequence. This is because the American government is planning to devote \$8 billion over the next 30 years to revitalise the Everglades. Seasonal freshwater flows into the Everglades are to be restored in order to improve the region's health. But they will then run off into the bay.

D.

Joseph Zieman, a marine ecologist at the University of Virginia, thinks this is a good idea. He believes that a lack of fresh water in the bay is its main problem. The blame, he says, lies with a century of drainage in the Everglades aimed at turning the marshes into farmland and areas for development. This has caused the flow of fresh water into Florida Bay to dwindle, making the water in the bay, overall, more saline. This, he argues, kills the seagrasses, and as these rot, nutrients are released that feed the microscopic plants and animals that live in the water. This, he says, is why the bay's once crystal-clear waters often resemble pea soup. And in a vicious circle, these turbid blooms block out sunlight, causing more seagrasses to die and yet more turbidity.

E.

Brian Lapointe, a marine scientist at the Harbour Branch Oceanographic Institution at Fort Pierce in Florida, disagrees. He thinks seagrasses can tolerate much higher levels of salinity than the bay actually displays. Furthermore, he notes that when freshwater flows through the Everglades were increased experimentally in the 1990s, it led to massive plankton blooms. Freshwater running off from well-fertilised farmlands, he says, caused a fivefold rise in nitrogen levels in the bay. This was like pouring fuel on a fire. The result was mass mortality of seagrasses because of increased turbidity from the plankton. Dr Lapointe adds that, because corals thrive only in waters where nutrient levels are low, restoring freshwater rich in nitrogen will do more damage to the reef.

F.

It is a plausible theory. The water flowing off crops that are grown on the 750,000 acres of heavily fertilised farmland on the northern edge of the Everglades is rich in nitrogen, half of which ends up in the bay. But Bill Kruczynski, of America's Environmental Protection Agency, is convinced that nitrogen from farmlands is not the chief problem. Some coral reefs well away from any nitrogen pollution are dying and, curiously, a few are thriving. Dr Kruczynski thinks that increased nutrients arriving from local sewage discharges from the thousands of cesspits along the Florida Keys are part of the problem.

G.

Such claims and counterclaims make the impact of the restoration plan difficult to predict. If increased salinity is the main problem, the bay's ecology will benefit from the Everglades restoration project. If, however, nitrogen is the problem, increasing the flow of freshwater could make matters much worse.

H.

If this second hypothesis proves correct, the cure is to remove nitrogen from farmland or sewage discharges, or perhaps both. Neither will be easy. Man-made wetlands, at present, being built to reduce phosphate runoff into the bay—also from fertilisers—would need an algal culture (a sort of contained algal bloom) added to them to deal with discharges from farmlands. That would be costly. So too would be the replacement of cesspits with proper sewerage—one estimate puts the cost at \$650m. Either way, it is clear that when, on December 1st, 3,000 square miles of sea around the reef are designated as a “protective zone” by the deputy secretary of commerce, Sam Bodman, this will do nothing to protect the reef from pollution.

I.

Some argue, though, that there is a more fundamental flaw in the plans for the bay: the very idea of returning it to a Utopian ideal before man wrought his damage. Nobody knows what Florida Bay was like before the 1950s when engineers cut the largest canals in the Everglades and took most of the water away. Dr Kruczynski suspects it was more like an estuary. The bay that many people wish to re-create could have been nothing more than

a changing phase in the bay's history.

J.

These arguments do not merely threaten to create ecological problems but economic ones as well. The economy of the Florida Keys depends on tourism—the local tourist industry has an annual turnover of \$2.5 billion. People come for fishing-boat trips, for manatee watching, or for scuba diving and snorkeling to view the exotically coloured corals. If the plan to restore the Everglades makes problems in the bay and the reef worse, it could prove a very expensive mistake.

Questions 1-4

The reading Passage has seven paragraphs A-J.

Which paragraph contains the following information?

Write the correct letter A-J, in boxes 1-4 on your answer sheet.

1. See grass turned to be more resistant to the saline water level in the Bay.
2. Significance of finding a specific reason in controversy
3. Expensive proposals raised to solve the nitrogen dilemma
4. A statistic of ecological changes in both the coral area and species

Questions 5-8

Use the information in the passage to match the people (listed A-C) with opinions or deeds below.

Write the appropriate letters A-C in boxes 5-8 on your answer sheet.

- A Bill Kruczynski
- B Brian Lapointe
- C Joseph Zieman

5. Drainage system in everglades actually results in high salty water in the bay.
6. Restoring water high in nitrogen level will make more ecological side effect
7. High nitrogen levels may be caused by the nearby farmland.
8. Released sewage rather than nutrients from agricultural area increase the level of Nitrogen.

Questions 9-13

Do the following statements agree with the information given in Reading Passage 2

In boxes 9-13 on your answer sheet, write

- TRUE** if the statement is true
- FALSE** if the statement is false
- NOT GIVEN** if the information is not given in the passage

9. Everyone agrees with “pouring water into the sea is harmless enough” even in the Florida Bay area.

10. Nitrogen was poured in from different types of crops as water flows through.
11. Everglade restoration project can be effective regardless of the cause of the pollution.
12. Human has changed Florida Bay where old image before 1950s is unrecalled.
13. Tourism contributes fundamentally to the Florida Bay area.

SECTION 2

You should spend about 20 minutes on Questions 14-27 which are based on Reading Passage 2 below.

Is Graffiti Art or Crime?

A.

The term graffiti derives from the Italian *graffito* meaning 'scratching' and can be defined as uninvited marking or writing scratched or applied to objects, built structures and natural features. It is not a new phenomenon: examples can be found on ancient structures around the world, in some cases predating the Greeks and Romans. In such circumstances it has acquired invaluable historical and archaeological significance, providing a social history of life and events at that time. Graffiti is now a problem that has become pervasive, as a result of the availability of cheap and quick means of mark-making.

B.

It is usually considered a priority to remove graffiti as quickly as possible after it appears. This is for several reasons. The first is to prevent 'copy-cat' emulation which can occur rapidly once a clean surface is defaced. It may also be of a racist or otherwise offensive nature and many companies and councils have a policy of removing this type of graffiti within an hour or two of it being reported. Also, as paints, glues and inks dry out over time they can become increasingly difficult to remove and are usually best dealt with as soon as possible after the incident. Graffiti can also lead to more serious forms of vandalism and, ultimately, the deterioration of an area, contributing to social decline.

C.

Although graffiti may be regarded as an eyesore, any proposal to remove it from sensitive historic surfaces should be carefully considered: techniques designed for more robust or utilitarian surfaces may result in considerable damage. In the event of graffiti incidents, it is important that the owners of buildings or other structures and their consultants are aware of the approach they should take in dealing with the problem. The police should be informed as there may be other related attacks occurring locally. An incidence pattern can identify possible culprits, as can stylised signatures or nicknames, known as 'tags', which may already be familiar to local police. Photographs are useful to record graffiti incident and may assist the police in bringing a prosecution. Such images are also required for insurance claims and can be helpful in cleaning operatives, allowing them to see the problem area before arriving on site.

D.

There are a variety of methods that are used to remove graffiti. Broadly these divide between chemical and mechanical systems. Chemical preparations are based on dissolving the media; these solvents can range from water to potentially hazardous

chemical 'cocktails'. Mechanical systems such as wire-brushing and grit-blasting attempt to abrade or chip the media from the surface. Care should be taken to comply with health and safety legislation with regard to the protection of both passers-by and any person carrying out the cleaning. Operatives should follow product guidelines in terms of application and removal, and wear the appropriate protective equipment. Measures must be taken to ensure that run-off, aerial mists, drips and splashes do not threaten unprotected members of the public. When examining a graffiti incident it is important to assess the ability of the substrate to withstand the prescribed treatment. If there is any doubt regarding this, then small trial areas should be undertaken to assess the impact of more extensive treatment.

E.

A variety of preventive strategies can be adopted to combat a recurring problem of graffiti at a given site. As no two sites are the same, no one set of protection measures will be suitable for all situations. Each site must be looked at individually. Surveillance systems such as closed-circuit television may also help. In cities and towns around the country, prominently placed cameras have been shown to reduce anti-social behavior of all types including graffiti. Security patrols will also act as a deterrent to prevent recurring attacks. However, the cost of this may be too high for most situations. A physical barrier such as a wall, railings, doors or gates can be introduced to discourage unauthorized access to a vulnerable site. However, consideration has to be given to the impact measures have on the structure being protected. In the worst cases, they can be almost as damaging to the quality of the environment as the graffiti they prevent. In others, they might simply provide a new surface for graffiti.

F.

One of the most significant problems associated with graffiti removal is the need to remove it from surfaces that are repeatedly attacked. Under these circumstances, the repeated removal of graffiti using even the most gentle methods will ultimately cause damage to the surface material. There may be situations where the preventive strategies mentioned above do not work or are not a viable proposition at a given site. Anti-graffiti coatings are usually applied by brush or spray leaving a thin veneer that essentially serves to isolate the graffiti from the surface.

G.

Removal of graffiti from a surface that has been treated in this way is much easier, usually using low-pressure water which reduces the possibility of damage. Depending on the type of barrier selected it may be necessary to reapply the coating after each graffiti removal exercise.

Questions 14-19

Reading passage 2 has seven paragraphs, **A-G**.

Which paragraph contains the following information?

*Write the correct letter, **A-G**, in boxes 14-19 on your answer sheet.*

NB You may use any letter more than once.

14. why chemically cleaning graffiti may cause damage
15. the benefit of a precautionary strategy on the gentle removal
16. the damaging and accumulative impact of graffiti on the community
17. the need for different preventive measures being taken to cope with graffiti
18. a legal proposal made to the owner of building against graffiti
19. the reasons for removing graffiti as soon as possible.

Questions 20-21

Choose **TWO** letters, **A-E**

Write your answers in boxes **20-21** on your answer sheet.

Which two statements are true concerning the removal of graffiti

- A** cocktail removal can be safer than water treatment
- B** small patch trial before applying large scale of removing
- C** Chemical treatments are the most expensive way of removing
- D** there are risks for both Chemical and medication method
- E** mechanical removals are much more applicable than Chemical treatments

Questions 22-23

Choose **TWO** letters, **A-E**.

Write your answers in boxes **22-23** on your answer sheet.

Which **TWO** of the following preventive measures against graffiti are mentioned effectively in the passage?

- A** organise more anti-graffiti movement in the city communities
- B** increase the police patrols on the street
- C** Build a new building with material repelling to water
- D** installing more visible security cameras
- E** Provide a whole new surface with a chemical coat

Questions 24-27

Complete the Summary of the paragraphs of Reading Passage 2.

Use **NO MORE THAN TWO WORDS** from the passage for each answer.

Write your answers in boxes **24-27** on your answer sheet.

Ancient graffiti is of significance and records the **24**.....of details life for that period.

The police can recognize newly committed incidents of graffiti by the signature which is called **25** that they are familiar with

Operatives ought to comply with relevant rules during the operation, and put on the suitable **26**.....

Removal of graffiti from a new type of coating surface can be much convenient of using **27**.....

SECTION 3

You should spend about 20 minutes on Questions 28-40, which are based on Reading Passage 3 below.

The Story Of Coffee

A.

Coffee was first discovered in Eastern Africa in an area we know today as Ethiopia. A popular legend refers to a goat herder by the name of Kaldi, who observed his goats acting unusually friskily after eating berries from a bush. Curious about this phenomenon, Kaldi tried eating the berries himself. He found that these berries gave him renewed energy.

B.

The news of this energy laden fruit quickly moved throughout the region. Coffee berries were transported from Ethiopia to the Arabian Peninsula, and were first cultivated in what today is the country of Yemen. Coffee remained a secret in Arabia before spreading to Turkey and then to the European continent by means of Venetian trade merchants.

C.

Coffee was first eaten as a food though later people in Arabia would make a drink out of boiling the beans for its narcotic effects and medicinal value. Coffee for a time was known as Arabian wine to Muslims who were banned from alcohol by Islam. It was not until after coffee had been eaten as a food product, a wine and a medicine that it was discovered, probably by complete accident in Turkey, that by roasting the beans a delicious drink could be made. The roasted beans were first crushed and then boiled in water, creating a crude version of the beverage we enjoy today. The first coffee houses were opened in Europe in the 17th Century and in 1675, the Viennese established the habit of refining the brew by filtering out the grounds, sweetening it, and adding a dash of milk.

D.

If you were to explore the planet for coffee, you would find about 60 species of coffee plants growing wild in Africa, Malaysia, and other regions. But only about ten of them are actually cultivated. Of these ten, two species are responsible for almost all the coffee produced in the world: *Coffea Arabica* and *Coffea Canephora* (usually known as Robusta). Because of ecological differences existing among the various coffee producing countries, both types have undergone many mutations and now exist in many sub-species.

E.

Although wild plants can reach 10 - 12 metres in height, the plantation one reaches a height of around four metres. This makes the harvest and flowering easier, and cultivation more economical. The flowers are white and sweet-scented like the Spanish jasmine.

Flowers give way to a red, darkish berry. At first sight, the fruit is like a big cherry both in size and in colour. The berry is coated with a thin, red film (epicarp) containing a white, sugary mucilaginous flesh (mesocarp). Inside the pulp there are the seeds in the form of two beans coupled at their flat surface. Beans are in turn coated with a kind of resistant, golden yellow parchment, (called endocarp). When peeled, the real bean appears with another very thin silvery film. The bean is bluish green verging on bronze, and is at the most 11 millimetres long and 8 millimetres wide.

F.

Coffee plants need special conditions to give a satisfactory crop. The climate needs to be hot-wet or hot temperate, between the Tropic of Cancer and the Tropic of Capricorn, with frequent rains and temperatures varying from 15 to 25 Degrees C. The soil should be deep, hard, permeable, well irrigated, with well-drained subsoil. The best lands are the hilly ones or from just-tilled woods. The perfect altitude is between 600 and 1200 metres, though some varieties thrive at 2000-2200 metres. Cultivation aimed at protecting the plants at every stage of growth is needed. Sowing should be in sheltered nurseries from which, after about six months, the seedlings should be moved to plantations in the rainy season where they are usually alternated with other plants to shield them from wind and excessive sunlight. Only when the plant is five years old can it be counted upon to give a regular yield. This is between 400 grams and two kilos of arabica beans for each plant, and 600 grams and two kilos for robusta beans.

G.

Harvesting time depends on the geographic situation and it can vary greatly therefore according to the various producing countries. First, the ripe beans are picked from the branches. Pickers can selectively pick approximately 250 to 300 pounds of coffee cherry a day. At the end of the day, the pickers bring their heavy burlap bags to pulping mills where the cherry coffee can be pulped (or wet milled). The pulped beans then rest, covered in pure rainwater to ferment overnight. The next day the wet beans are hand-distributed upon the drying floor to be sun dried. This drying process takes from one to two weeks depending on the amount of sunny days available. To make sure they dry evenly, the beans need to be raked many times during this drying time. Two weeks later the sun dried beans, now called parchment, are scooped up, bagged and taken to be milled. Huge milling machines then remove the parchment and silver skin, which renders a green bean suitable for roasting. The green beans are roasted according to the customers' specifications and, after cooling, the beans are then packaged and mailed to customers.

Questions 28 - 33

The reading passage on The Story of Coffee has **7** paragraphs **A – G**.

From the list of headings below choose the most suitable headings for paragraphs **B – G**.

Write the appropriate number (**i – xi**) in boxes **28 – 33** on your answer sheet.

NB There are more headings than paragraphs, so you will not use them all.

i. Growing Coffee

- ii. Problems with Manufacture
- iii. Processing the Bean
- iv. First Contact
- v. Arabian Coffee
- vi. Coffee Varieties
- vii. Modern Coffee
- viii. The Spread of Coffee
- ix. Consuming Coffee
- x. Climates for Coffee
- xi. The Coffee Plant

Example Answer
Paragraph A **iv**

- 28. Paragraph B
- 29. Paragraph C
- 30. Paragraph D
- 31. Paragraph E
- 32. Paragraph F
- 33. Paragraph G

Questions 34 – 36

Complete the labels on the diagram of a coffee bean below.
 Choose your answers from the text and write them in boxes **34 - 36** on your answer sheet.

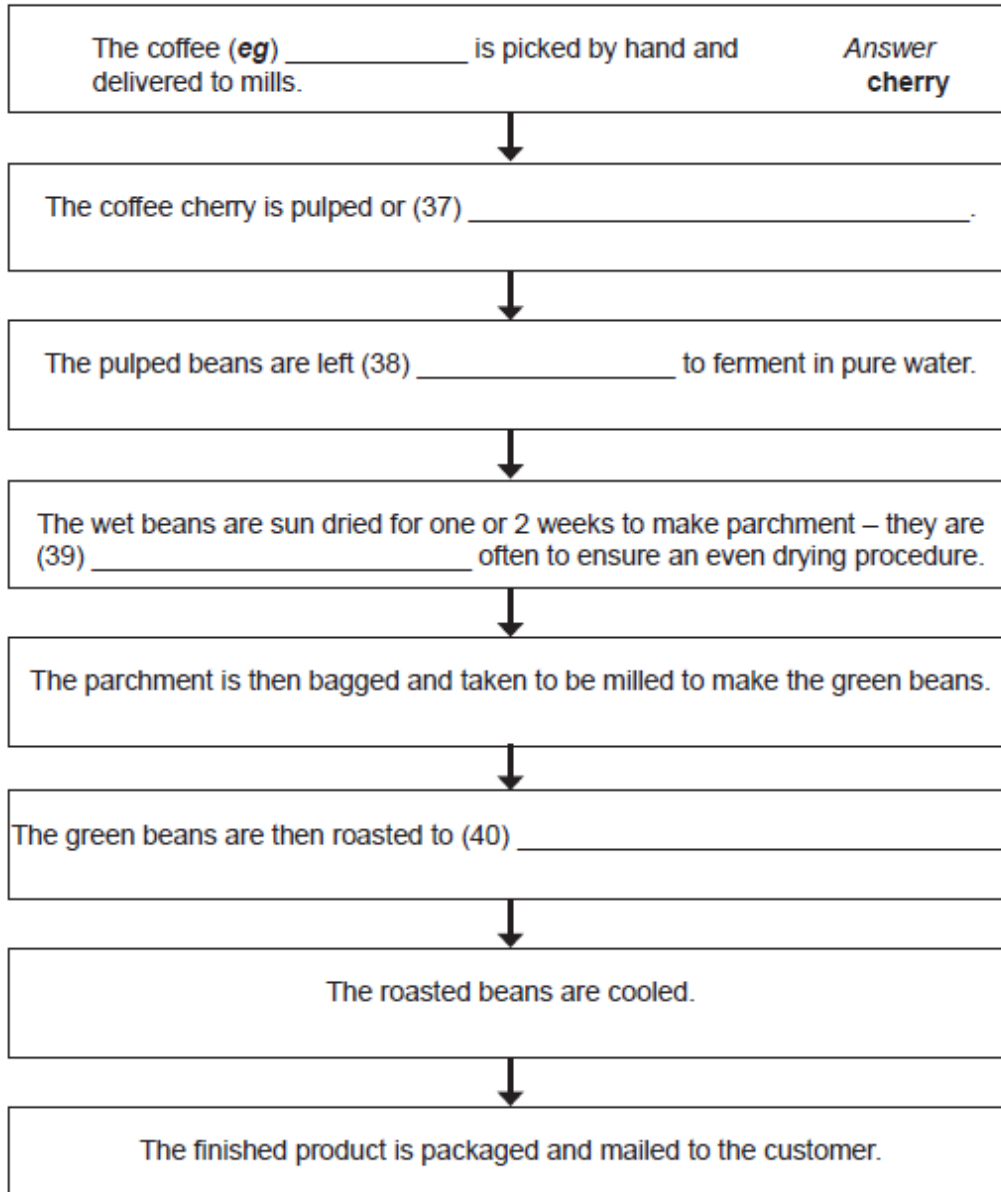

Questions 37 – 40

Using the information in the passage, complete the flow chart below.

Write your answers in boxes **37 – 40** on your answer sheet.

Use **NO MORE THAN THREE WORDS** from the passage for each answer.

The Coffee Production Process

Reading Test 5

SECTION 1

You should spend about 20 minutes on Questions 1-14 which are based on Reading Passage 1

Keep a Watchful Eye on the Bridges

A.

Most road and rail bridges are only inspected visually, if at all. Every few months, engineers have to clamber over the structure in an attempt to find problems before the bridge shows obvious signs of damage. Technologies developed at Los Alamos National Laboratory, New Mexico, and Texas A&M University may replace these surveys with microwave sensors that constantly monitor the condition of bridges.

B.

“The device uses microwaves to measure the distance between the sensor and the bridge, much like radar does,” says Albert Migliori, a Los Alamos physicist “Any load on the bridge – such as traffic induces displacements, which change that distance as the bridge moves up and down.” By monitoring these movements over several minutes, the researchers can find out how the bridge resonates. Changes in its behaviour can give an early warning of damage.

C.

The Interstate 40 bridge over the Rio Grande river in Albuquerque provided the researchers with a rare opportunity to test their ideas. Chuck Farrar, an engineer at Los Alamos, explains: “The New Mexico authorities decided to raze this bridge and replace it. We were able to mount instruments on it, test it under various load conditions and even inflict damage just before it was demolished.” In the 1960s and 1970s, 2500 similar bridges were built in the US. They have two steel girders supporting the load in each section. Highway experts know that this design is “fracture critical” because a failure in either girder would cause the bridge to fail.

D.

After setting up the microwave dish on the ground below the bridge, the Los Alamos team installed conventional accelerometers at several points along the span to measure its motion. They then tested the bridge while traffic roared across it and while subjecting it to pounding from a “shaker”, which delivered precise punches to a specific point on the road.

E.

“We then created damage that we hoped would simulate fatigue cracks that can occur in steel girders,” says Farrar. They first cut a slot about 60 centimetres long in the middle of one girder. They then extended the cut until it reached the bottom of the girder and finally they cut across the flange – the bottom of the girder’s “I” shape.

F. The initial, crude analysis of the bridge’s behaviour, based on the frequency at which the bridge resonates, did not indicate that anything was wrong until the flange was damaged. But later the data were reanalysed with algorithms that took into account changes in the mode shapes of the structure – shapes that the structure takes on when excited at a particular frequency. These more sophisticated algorithms, which were developed by Norris Stubbs at Texas A&M University, successfully identified and located the damage caused by the initial cut.

G.

“When any structure vibrates, the energy is distributed throughout with some points not moving, while others vibrate strongly at various frequencies,” says Stubbs. “My algorithms use pattern recognition to detect changes in the distribution of this energy.” NASA already uses Stubbs’ method to check the behaviour of the body flap that slows space shuttles down after they land.

H.

A commercial system based on the Los Alamos hardware is now available, complete with the Stubbs algorithms, from the Quatro Corporation in Albuquerque for about \$100,000. Tim Darling, another Los Alamos physicist working on the microwave interferometer with Migliori, says that as the electronics become cheaper, a microwave inspection system will eventually be applied to most large bridges in the US. “In a decade I would like to see a battery or solar-powered package mounted under each bridge, scanning it every day to detect changes,” he says.

Questions 1-4

Choose the correct answer A, B, C or D and write your answer next to 1-4 on your answer sheet

1. How did the traditional way to prevent damage to the bridges before the invention of the new monitoring system?

- A. Bridges have to be tested in every movement on two points.
- B. Bridges have to be closely monitored by microwave devices.
- C. Bridges have already been monitored by sensors.
- D. Bridges have to be frequently inspected by professional workers with naked eyes.

2. How does the new microwave monitors find out the problems of bridges?

- A. by changing the distance between the positions of devices

- B. by controlling the traffic flow on the bridges
- C. by monitoring the distance caused by traffic between two points
- D. by displacement of the several critical parts in the bridges

3. Why did the expert believe there is a problem for the design called “fracture critical”?

- A. Engineers failed to apply the newly developed construction materials.
- B. There was not enough finance to repair the bridges.
- C. The supporting parts of the bridges may crack and cause the bridge to fail.
- D. There were bigger traffic load conditions than the designers had anticipated.

4. The defect was not recognized by a basic method in the beginning?

- A. until the mid of faces of bridges has fractured.
- B. until the damage appears along and down to the flanges.
- C. until the points on the road have been punched.
- D. until the frequency of resonates appears disordered.

Questions 5-8

Filling the blanks in the diagram labels.

Write the correct answer in the blank space next to 5-8 on your answer sheet

The diagram of monitoring a bridge

Questions 9-13

The reading passage has eight paragraphs, A-H.

Which paragraph contains the following information?

Write the correct letter, A-H, in boxes on your answer sheet.

9. how is the pressure that they have many a great chance to test bridges. _____

10. a ten-year positive change for microwave device. _____

11. the chance they get an honourable contract. _____

12. explanation of the mechanism for the new microwave monitoring to work. _____

13. how is the damage deliberately created by the researchers. _____

SECTION 2

You should spend about 20 minutes on Questions 14-26 which are based on Reading Passage 2 below.

Coral reefs

Coral reefs are underwater structures made from calcium carbonate secreted by corals. Coral reefs are colonies of tiny living animals found in marine waters that contain few nutrients. Most coral reefs are built from stony corals, which in turn consist of polyps that cluster in groups.

A.

Coral reefs are estimated to cover 284,300 km² just under 0.1% of the oceans' surface area, about half the area of France. The Indo-Pacific region accounts for 91.9% of this total area. Southeast Asia accounts for 32.3% of that figure, while the Pacific including Australia accounts for 40.8%. Atlantic and Caribbean coral reefs account for 7.6%. Yet often called —rainforests of the seall, coral reefs form some of the most diverse ecosystems on Earth. They provide a home for 25% of all marine species, including fish, mollusks worms, crustaceans, echinoderms, sponges, tunicates and other cnidarians. Paradoxically, coral reefs flourish even though they are surrounded by ocean waters that provide few nutrients. They are most commonly found at shallow depths in tropical waters, but deep water and cold water corals also exist on smaller scales in other areas. Although corals exist both in temperate and tropical waters, shallow-water reefs form only in a zone extending from 30°N to 30°S of the equator. Deepwater coral can exist at greater depths and colder temperatures at much higher latitudes, as far north as Norway. Coral reefs are rare along the American and African west coasts. This is due primarily to upwelling and strong cold coastal currents that reduce water temperatures in these areas (respectively the Peru, Benguela and Canary streams). Corals are seldom found along the coastline of South Asia from the eastern tip of India (Madras) to the Bangladesh and Myanmar borders. They are also rare along the coast around northeastern South America and Bangladesh due to the freshwater released from the Amazon and Ganges Rivers, respectively.

B.

Coral reefs deliver ecosystem services to tourism, fisheries and coastline protection. The global economic value of coral reefs has been estimated at as much as \$US375 billion per year. Coral reefs protect shorelines by absorbing wave energy, and many small islands would not exist without their reef to protect them.

C.

The value of reefs in biodiverse regions can be even higher. In parts of Indonesia and the Caribbean where tourism is the main use, reefs are estimated to be worth US\$1 million per square kilometer, based on the cost of maintaining sandy beaches and the value of attracting snorkelers and scuba divers. Meanwhile, a recent study of the Great Barrier

Reef in Australia found that the reef is worth more to the country as an intact ecosystem than an extractive reserve for fishing. Each year more than 1.8 million tourists visit the reef, spending an estimated AU\$4.3 billion (Australian dollars) on reef-related industries from diving to boat rental to posh island resort stays. In the Caribbean, says UNEP, the net annual benefits from diver tourism were US\$2 billion in 2000 with US\$625 million spent directly on diving on reefs. Further, reef tourism is an important source of employment, especially for some of the world's poorest people. UNEP says that of the estimated 30 million small-scale fishers in the developing world, most are dependent to a greater or lesser extent on coral reefs. In the Philippines, for example, more than one million small-scale fishers depend directly on coral reefs for their livelihoods. The report estimates that reef fisheries were worth between \$15,000 and \$150,000 per square kilometer a year, while fish caught for aquariums were worth \$500 a kilogram against \$6 for fish caught as food. The aquarium fish export industry supports around 50,000 people and generates some US\$5.5 million a year in Sri Lanka along.

D.

Unfortunately, coral reefs are dying around the world. In particular, coral mining, agricultural and urban runoff, pollution (organic and inorganic), disease, and the digging of canals and access into islands and bays are localized threats to coral ecosystems. Broader threats are sea temperature rise, sea-level rise and pH changes from ocean acidification, all associated with greenhouse gas emissions. Some current fishing practices are destructive and unsustainable. These include cyanide fishing, overfishing and blast fishing. Although cyanide fishing supplies live reef fish for the tropical aquarium market, most fish caught using this method are sold in restaurants, primarily in Asia, where live fish are prized for their freshness. To catch fish with cyanide, fishers dive down to the reef and squirt cyanide in coral crevices and on the fast-moving fish, to stun the fish making them easy to catch. Overfishing is another leading cause for coral reef degradation. Often, too many fish are taken from one reef to sustain a population in that area. Poor fishing practices, such as banging on the reef with sticks (muro-ami), destroy coral formations that normally function as fish habitat. In some instances, people fish with explosives (blast fishing), which blast apart the surrounding coral.

E.

Tourist resorts that empty their sewage directly into the water surrounding coral reefs contribute to coral reef degradation. Wastes kept in poorly maintained septic tanks can also leak into surrounding groundwater, eventually seeping out to the reefs. Careless boating, diving, snorkeling and fishing can also damage coral reefs. Whenever people grab, kick, and walk on, or stir up sediment in the reefs, they contribute to coral reef destruction. Corals are also harmed or killed when people drop anchors on them or when people collect coral.

F.

To find answers for these problems, scientists and researchers study the various factors that impact reefs. The list includes the ocean's role as a carbon dioxide sink, atmospheric

changes, ultraviolet light, ocean acidification, viruses, impacts of dust storms carrying agents to far-flung reefs, pollutants, algal blooms and others. Reefs are threatened well beyond coastal areas. General estimates show approximately 10% of the world's coral reefs are dead. About 60% of the world's reefs are at risk due to destructive, human-related activities. The threat to the health of reefs is particularly strong in Southeast Asia, where 80% of reefs are endangered.

G.

In Australia, the Great Barrier Reef is protected by the Great Barrier Reef Marine Park Authority and is the subject of much legislation, including a biodiversity action plan. Inhabitants of Ahus Island, Manus Province, Papua New Guinea, have followed a generations-old practice of restricting fishing in six areas of their reef lagoon. Their cultural traditions allow line fishing, but not net or spearfishing. The result is both the biomass and individual fish sizes are significantly larger in these areas than in places where fishing is unrestricted.

Questions 14-19

The reading Passage has seven paragraphs A-G.
Which paragraph contains the following information?
Write the correct letter A-G, in boxes 14-19 on your answer sheet.

NB You may use any letter more than once.

14. Geographical Location of the world's coral reef
15. How does coral reef benefit economy locally
16. The statistics of coral reef's economic significance
17. The listed reasons for the declining number of coral reef
18. Physical approach to the coral reef by people
19. Unsustainable fishing methods are applied in regions of the world

Questions 20-25

Do the following statements agree with the information given in Reading Passage 2?
Write your answers in boxes 20-25 on your answer sheet.

TRUE if the statement is true
FALSE if the statement is false
NOT GIVEN if the information is not given in the passage

20. Coral reefs provide habitat to a variety of marine life.
21. Coral reef distributes around the ocean disproportionately.
22. Coral reef is increasingly important for scientific purpose.
23. Coral reefs are greatly exchanged among and exported to other counties.
24. Reef tourism is of economic essence generally for some poor people.
25. As with other fishing business, coral fishery is not suitable to women and children

Question 26

Choose the correct letter, A, B, C or D.

Write your answers in boxes 26 on your answer sheet.

What is the main purpose of this passage?

- A. Demonstrate how coral reef growth in the ocean
- B. To tell that coral reef is widely used as a scientific project
- C. Present the general benefits and an alarming situation of coral reef
- D. To show the vital efforts made to protect the coral reef in Australia

SECTION 3

You should spend about 20 minutes on Questions 27-40, which are based on Reading Passage 3 below.

The Future of Fish

A.

The face of the ocean has changed completely since the first commercial fishers cast their nets and hooks over a thousand years ago. Fisheries intensified over the centuries, but even by the nineteenth century it was still felt, justifiably, that the plentiful resources of the sea were for the most part beyond the reach of fishing, and so there was little need to restrict fishing or create protected areas. The twentieth century heralded an escalation in fishing intensity that is unprecedented in the history of the oceans, and modern fishing technologies leave fish no place to hide. Today, the only refuges from fishing are those we deliberately create. Unhappily, the sea trails far behind the land in terms of the area and the quality of protection given.

For centuries, as fishing and commerce have expanded, we have held onto the notion that the sea is different from the land. We still view it as a place where people and nations should be free to come and go at will, as well as somewhere that should be free for us to exploit. Perhaps this is why we have been so reluctant to protect the sea. On land, protected areas have proliferated as human populations have grown. Here, compared to the sea, we have made greater headway in our struggle to maintain the richness and variety of wildlife and landscape. Twelve percent of the world's land is now contained in protected areas, whereas the corresponding figure for the sea is but three-fifths of one percent. Worse still, most marine protected areas allow some fishing to continue. Areas off-limits to all exploitation cover something like one five-thousandth of the total area of the world's seas.

B.

Today, we are belatedly coming to realise that 'natural refuges' from fishing have played a critical role in sustaining fisheries, and maintaining healthy and diverse marine ecosystems. This does not mean that marine reserves can rebuild fisheries on their own - other management measures are also required for that. However, places that are off-limits to fishing constitute the last and most important part of our package of reform for fisheries management. They underpin and enhance all our other efforts. There are limits to protection though.

C.

Reserves cannot bring back what has died out. We can never resurrect globally extinct species, and restoring locally extinct animals may require reintroductions from elsewhere, if natural dispersal from remaining populations is insufficient. We are also seeing, in cases such as northern cod in Canada, that fishing can shift marine ecosystems into different states, where different mixes of species prevail. In many cases, these species are less desirable, since the prime fishing targets have gone or are much reduced in numbers,

and changes may be difficult to reverse, even with a complete moratorium on fishing. The Mediterranean sailed by Ulysses, the legendary king of ancient Greece, supported abundant monk seals, loggerhead turtles and porpoises. Their disappearance through hunting and overfishing has totally restructured food webs, and recovery is likely to be much harder to achieve than their destruction was. This means that the sooner we act to protect marine life, the more certain will be our success.

D.

To some people, creating marine reserves is an admission of failure. According to their logic, reserves should not be necessary if we have done our work properly in managing the uses we make of the sea. Many fisheries managers are still wedded to the idea that one day their models will work, and politicians will listen to their advice. Just give the approach time, and success will be theirs. How much time have we got? This approach has been tried and refined for the last 50 years. There have been few successes which to feather the managers' caps, but a growing litany of failure. The Common Fisheries Policy, the European Union's instrument for the management of fisheries and aquaculture, exemplifies the worst pitfalls: flawed models, flawed advice, watered-down recommendations from government bureaucrats and then the disregard of much of this advice by politicians. When it all went wrong, as it inevitably had to, Europe sent its boats to other countries in order to obtain fish for far less than they were actually worth.

We are squandering the wealth of oceans. If we don't break out of this cycle of failure, humanity will lose a key source of protein, and much more besides. Disrupting natural ecosystem processes, such as water purification, nutrient cycling, and carbon storage, could have ramifications for human life itself. We can go a long way to avoiding this catastrophic mistake with simple common sense management. Marine reserves lie at the heart of the reform. But they will not be sufficient if they are implemented only here and there to shore up the crumbling edifice of the 'rational fisheries management' envisioned by scientists in the 1940s and 1950s. They have to be placed centre stage as a fundamental underpinning for everything we do in the oceans. Reserves are a first resort, not a final resort when all else fails.

Questions 27-31

Do the following statements agree with the views of the writer in Reading Passage 3?

Write

YES if the statement agrees with the claims of the writer

NO if the statement contradicts the claims of the writer

NOT GIVEN if it is impossible to say what the writer thinks about this

27. It is more than a thousand years since people started to catch fish for commercial use.

28. In general, open access to the oceans is still regarded as desirable.

29. Sea fishing is now completely banned in the majority of protected areas.

30. People should be encouraged to reduce the amount of fish they eat.

31. The re-introduction of certain mammals to the Mediterranean is a straightforward task.

Questions 32-34

Choose the correct letter, **A**, **B**, **C** or **D** and write them in boxes 32,33,34 on your answer sheet

32. What does the writer mean with the question, 'How much time have we got?' in the fifth paragraph?

- A.** Fisheries policies are currently based on uncertain estimates.
- B.** Accurate predictions will allow governments to plan properly.
- C.** Fisheries managers should provide clearer information.
- D.** Action to protect fish stocks is urgently needed.

33. What is the writer's comment on the Common Fisheries Policy?

- A.** Measures that it advocated were hastily implemented.
- B.** Officials exaggerated some of its recommendations.
- C.** It was based on predictions which were inaccurate.
- D.** The policy makers acquired a good reputation.

34. What is the writer's conclusion concerning the decline of marine resources?

- A.** The means of avoiding the worst outcomes needs to be prioritised.
- B.** Measures already taken to avoid a crisis are probably sufficient.
- C.** The situation is now so severe that there is no likely solution.
- D.** It is no longer clear which measures would be most effective.

Questions 35-40

Complete the summary using the list of words/phrases, **A-J**, below.

Measures to protect the oceans

Up till the twentieth century the world's supply of fish was sufficient for its needs.

It was unnecessary to introduce **35** _____ of any kind, because large areas of the oceans were inaccessible.

However, as **36** _____ improved, this situation changed, and in the middle of the twentieth century, policies were introduced to regulate **37** _____

These policies have not succeeded. Today, by comparison with **38** _____ the oceans have very little legal protection.

Despite the doubts that many officials have about the concept of **39** _____, these should be at the heart of any action taken.

The consequences of further **40** _____ are very serious, and may even affect our continuing existence.

- A** action
- B** controls
- C** failure
- D** fish catches
- E** fish processing

F fishing techniques

G large boats

H marine reserves

I the land

J the past

Reading Test 6

SECTION 1

You should spend about 20 minutes on Questions 1-13 which are based on Reading Passage 1

How to Spot a liar

A.

However much we may abhor it, deception comes naturally to all living things. Birds do it by feigning injury to lead hungry predators away from nesting young. Spider crabs do it by disguise: adorning themselves with strips of kelp and other debris, they pretend to be something they are not – and so escape their enemies. Nature amply rewards successful deceivers by allowing them to survive long enough to mate and reproduce. So it may come as no surprise to learn that human beings- who, according to psychologist Gerald Johnson of the University of South California, or lied to about 200 times a day, roughly one untruth every 5 minutes- often deceive for exactly the same reasons: to save their own skins or to get something they can't get by other means.

B.

But knowing how to catch deceit can be just as important a survival skill as knowing how to tell a lie and get away with it. A person able to spot falsehood quickly is unlikely to be swindled by an unscrupulous business associate or hoodwinked by a devious spouse. Luckily, nature provides more than enough clues to trap dissemblers in their own tangled webs- if you know where to look. By closely observing facial expressions, body language and tone of voice, practically anyone can recognise the tell-tale signs of lying. Researchers are even programming computers – like those used on Lie Detector -to get at the truth by analysing the same physical cues available to the naked eye and ear. "With the proper training, many people can learn to reliably detect lies," says Paul Ekman, professor of psychology at the University of California, San Francisco, who has spent the past 15 years studying the secret art of deception.

C.

In order to know what kind of Lies work best, successful liars need to accurately assess other people's emotional states. Ackman's research shows that this same emotional intelligence is essential for good lie detectors, too. The emotional state to watch out for is stress, the conflict most liars feel between the truth and what they actually say and do.

D.

Even high-tech lie detectors don't detect lies as such; they merely detect the physical cues of emotions, which may or may not correspond to what the person being tested is

saying. Polygraphs, for instance, measure respiration, heart rate and skin conductivity, which tend to increase when people are nervous – as they usually are when lying.

E.

Nervous people typically perspire, and the salts contained in perspiration conducts electricity. That's why sudden leap in skin conductivity indicates nervousness -about getting caught, perhaps -which makes, in turn, suggest that someone is being economical with the truth. On the other hand, it might also mean that the lights in the television Studio are too hot- which is one reason polygraph tests are inadmissible in court. "Good lie detectors don't rely on a single thing" says Ekma ,but interpret clusters of verbal and non-verbal clues that suggest someone might be lying."

F.

The clues are written all over the face. Because the musculature of the face is directly connected to the areas of the brain that processes emotion, the countenance can be a window to the soul. Neurological studies even suggest that genuine emotions travel different pathways through the brain than insincere ones. If a patient paralyzed by stroke on one side of the face, for example, is asked to smile deliberately, only the mobile side of the mouth is raised. But tell that same person a funny joke, and the patient breaks into a full and spontaneous smile. Very few people -most notably, actors and politicians- are able to consciously control all of their facial expressions. Lies can often be caught when the liars true feelings briefly leak through the mask of deception. We don't think before we feel, Ekman says. "Expressions tend to show up on the face before we're even conscious of experiencing an emotion."

G.

One of the most difficult facial expressions to fake- or conceal, if it's genuinely felt - is sadness. When someone is truly sad, the forehead wrinkles with grief and the inner corners of the eyebrows are pulled up. Fewer than 15% of the people Ekman tested were able to produce this eyebrow movement voluntarily. By contrast, the lowering of the eyebrows associated with an angry scowl can be replicated at will but almost everybody. " If someone claims they are sad and the inner corners of their eyebrows don't go up, Ekman says, the sadness is probably false."

H.

The smile, on the other hand, is one of the easiest facial expressions to counterfeit. It takes just two muscles -the zygomaticus major muscles that extend from the cheekbones to the corners of the lips- to produce a grin. But there's a catch. A genuine smile affects not only the corners of the lips but also the orbicularis oculi, the muscle around the eye that produces the distinctive "crow's feet" associated with people who laugh a lot. A counterfeit grin can be unmasked if the corners of the lips go up, the eyes crinkle, but the inner corners of the eyebrows are not lowered, a movement controlled by the orbicularis oculi that is difficult to fake. The absence of lowered eyebrows is one reason why the

smile looks so strained and stiff.

Questions 1-5

Do the following statements agree with the claims of the writer in Reading Passage?

In boxes **1-5** on your answer sheet, write

YES - if the statement agrees with the information

NO - if the statement contradicts the information

NOT GIVEN - if there is no information on this

1. All living animals can lie.
2. Some people tell lies for self-preservation.
3. Scientists have used computers to analyze which part of the brain is responsible for telling lies.
4. Lying as a survival skill is more important than detecting a lie.
5. To be a good liar, one has to understand other people's emotions.

Questions 6-9

Choose the correct letter **A, B, C** or **D**.

Write your answers in boxes 6-9.

6. How does the lie detector work?
 - A It detects whether one's emotional state is stable.
 - B It detects one's brain activity level.
 - C It detects body behavior during one's verbal response.
 - D It analyses one's verbal response word by word.
7. Lie detectors can't be used as evidence in a court of law because
 - A Lights often cause lie detectors to malfunction.
 - B They are based on too many verbal and non-verbal clues.
 - C Polygraph tests are often inaccurate.
 - D There may be many causes of certain body behavior.
8. Why does the author mention the paralyzed patients?
 - A To demonstrate how a paralyzed patient smiles
 - B To show the relation between true emotions and body behavior
 - C To examine how they were paralyzed
 - D To show the importance of happiness from recovery
9. The author uses politicians to exemplify that they can
 - A Have emotions.
 - B Imitate actors.

- C** Detect other people's lives.
- D** Mask their true feelings.

Questions 10-13

Classify the following facial traits as referring to

- A** sadness
- B** anger
- C** happiness

Write the correct letter **A**, **B** or **C** in boxes **10-13**.

- 10.** ABC Inner corners of eyebrows raised
- 11.** ABC The whole eyebrows lowered
- 12.** ABC Lines formed around
- 13.** ABC Lines form above eyebrows

SECTION 2

You should spend about 20 minutes on Questions 14-26, which are based on Reading Passage 2 below.

The Study of Chimpanzee Culture

A.

After studying the similarities between chimpanzees and humans for years, researchers have recognised these resemblances run much deeper than anyone first thought in the latest decade. For instance, the nut cracking observed in the Tai Forest is not a simple chimpanzee behaviour, but a separate adaptation found only in that particular part of Africa, as well as a trait which is considered to be an expression of chimpanzee culture by biologists. These researchers frequently quote the word 'culture' to describe elementary animal behaviours, like the regional dialects of different species of songbirds, but it turns out that the rich and varied cultural traditions chimpanzees enjoyed rank secondly in complexity only to human traditions.

B.

During the past two years, the major research group which studies chimpanzees collaborated unprecedentedly and documented some distinct cultural patterns, ranging from animals' use of tools to their forms of communication and social customs. This emerging picture of chimpanzees affects how human beings ponder upon these amazing creatures. Also, it alters our conception of human uniqueness and shows us the extraordinary ability of our ancient ancestors to create cultures.

C.

Although we know that *Homo sapiens* and *Pan Troglodytes* have coexisted for hundreds of millennia and their genetic similarities surpass 98 per cent, we still knew next to nothing about chimpanzee behaviour in the wild until 40 years ago. All this began to change in the 1960s when Toshisada Nishida of Kyoto University in Japan and renowned British primatologist Jane Goodall launched their studies of wild chimpanzees at two field sites in Tanzania. (Goodall's research station at Gombe—the first of its kind—is more famous, but Nishida's site at Mahale is the second oldest chimpanzee research site in the world.)

D.

During these primary studies, as the chimpanzees became more and more accustomed to close observation, the remarkable discoveries emerged. Researchers witnessed a variety of unexpected behaviours, ranging from fashioning and using tools, hunting, meat eating, food sharing to lethal fights between members of neighbouring communities.

E.

In 1973, 13 forms of tool use and 8 social activities which appeared to differ between the Gombe chimpanzees and chimpanzee species elsewhere were recorded by Goodall. She

speculated that some variations shared what she referred to as a 'cultural origin'. But what exactly did Goodall mean by 'culture'? According to the Oxford Encyclopedic English Dictionary, culture is defined as 'the customs. . .and achievements of a particular time or people.' The diversity of human cultures extends from technological variations to marriage rituals, from culinary habits to myths and legends. Of course, animals do not have myths and legends, but they do share the capacity to pass on behavioural traits from one generation to another, not through their genes but via learning. From biologists' view, this is the fundamental criterion for a cultural trait—something can be learnt by observing the established skills of others and then passed on to following generations.

F.

What are the implications for chimpanzees themselves? We must place a high value upon the tragic loss of chimpanzees, who are decimated just when finally we are coming to appreciate these astonishing animals more completely. The population of chimpanzees has plummeted and continued to fall due to illegal trapping, logging and, most recently, the bushmeat trade within the past century. The latter is particularly alarming because logging has driven roadways, which are now used to ship wild animal meat—including chimpanzee meat to consumers as far afield as Europe, into forests. Such destruction threatens not only the animals themselves but also a host of fascinatingly different ape cultures.

G.

However, the cultural richness of the ape may contribute to its salvation. For example, the conservation efforts have already altered the attitudes of some local people. After several organisations showed videotapes illustrating the cognitive prowess of chimpanzees, one Zairian viewer was heard to exclaim, 'Ah, this ape is so like me, I can no longer eat him.'

H.

How did an international team of chimpanzee experts perform the most comprehensive survey of the animals ever attempted? Although scientists have been delving into chimpanzee culture for several decades, sometimes their studies contained a fatal defect. So far, most attempts to document cultural diversity among chimpanzees have solely relied upon officially published accounts of the behaviours reported at each research site. But this approach probably neglects a good deal of cultural variation for three reasons.

I.

First, scientists normally don't publish an extensive list of all the activities they do not see at a particular location. Yet this is the very information we need to know—which behaviours were and were not observed at each site. Second, there are many reports describing chimpanzee behaviours without expressing how common they are; without this information, we can't determine whether a particular action was a transient phenomenon or a routine event that should be considered part of its culture. Finally, researchers' description of potentially significant chimpanzee behaviours often lacks sufficient detail,

which makes it difficult for scientists from other spots to report the presence or absence of the activities.

J.

To tackle these problems, my colleague and I determined to take a new approach. We asked field researchers at each site to list all the behaviours which they suspected were local traditions. With this information, we assembled a comprehensive list of 65 candidates for cultural behaviours.

K.

Then we distributed our list to team leaders at each site. They consulted with their colleagues and classified each behaviour regarding its occurrence or absence in the chimpanzee community. The major brackets contained customary behaviour (occurs in most or all of the able-bodied members of at least one age or sex class, such as all adult males), habitual (less common than customary but occurs repeatedly in several individuals), present (observed at the site but not habitual), absent (never seen), and unknown.

Questions 14-18

Reading Passage 2 has eleven paragraphs, A-K.

Which paragraph contains the following information?

Write the correct letter, A-K, in boxes 14-18 on your answer sheet.

14. an approach to research on chimpanzees culture that is only based on official sources
15. mention of a new system designed by two scientists who aim to solve the problem
16. reasons why previous research on ape culture is problematic
17. new classification of data observed or collected
18. an example showing that the tragic outcome of animals leads to an indication of a change in local people's attitude in the preservation

Questions 19-23

Do the following statements agree with the information given in Reading Passage 2?

In boxes 19-23 on your answer sheet, write

TRUE if the statement is true

FALSE if the statement is false

NOT GIVEN if the information is not given in the passage

19. The research found that scientists can make chimpanzees possess the same complex culture as human beings.
20. Humans and apes lived together long time ago and shared most of their genetic substance.
21. Even Toshisada Nishida and Jane Goodall's beginning studies observed many surprising features of civilised behaviours among chimpanzees.
22. Chimpanzees, like humans, have the ability to deliver cultural behaviours mostly

from genetic inheritance.

23. For decades, researchers have investigated chimpanzees by data obtained from both unobserved and observed approaches.

Questions 24-27

Answer the questions below.

Choose NO MORE THAN TWO WORDS AND/OR A NUMBER from the passage for each answer. Write your answers in boxes 24-27 on your answer sheet.

When did the unexpected discoveries of chimpanzee behaviour start?

24.

Which country is the researching site of Toshisada Nishida and Jane Goodall?

25.

What did the chimpanzee have to get used to in the initial study?

26.

What term can be used to depict that Jane Goodall found the chimpanzees in different regions used the different tools in 1973?

27.

SECTION 3

You should spend about 20 minutes on Questions 27-40, which are based on Reading Passage 3 below

Section A

Shoes—we wear them nearly every day. We walk, run, jump, climb, and stand in them for hours on end. Yet we hardly think about them because they are such an ordinary part of our daily lives. Shoes were not always an important part of people’s wardrobes. The ancient Greeks, Egyptians, and Persians made and wore sandals, but actually went barefoot most of the time. These people lived in regions where the weather was temperate, and shoes were not needed to keep their feet warm. Archaeologists have found shoes in the ruins of these civilizations, but they seem to have been worn mainly by royalty, who could afford to employ tailors and shoemakers.

Section B

As shoes became more common in ancient Egypt, the first ones were simple sandals created mainly to protect the soles of the feet from rough surfaces. The easiest way to make shoes in these ancient times was to use materials that were readily available, including tree bark, leaves, and grasses. In ancient Egypt, sandals were made of rushes, which are grassy plants with hollow stalks. Rushes are the same plants used today to make chair bottoms, mats, and baskets.

Among the ancient Greeks, sandals were woven of similar plant materials, but the Greeks also varied the process by tying small pieces of wood together with dried grass. In later years, they made sandals with leather from the hides of animals. The first Greek shoes were purely functional, but over time most were dyed and decorated to make fashion statements. Women began to wear soft, enclosed leather shoes, and these grew increasingly fancy in the later years of the Greek civilization.

The Romans wore sandals much like the Greeks did, but used more pieces of leather to make them. Some Roman sandals had straps that wrapped around the ankles. Shoemakers often dyed these sandals in bright colors that represented the different jobs held by the people wearing them. The patricians, or privileged classes, wore red sandals with moon-shaped ornaments on the back. Senators wore brown shoes with four black leather straps wound around the lower leg. Consuls, or legal officers, wore white shoes, and soldiers wore heavy leather sandals that were more like boots—but with bare toes!

Meanwhile, people who lived in cold northern climates were making their shoes from the hides of furry animals, such as polar bears and yaks. The soles and tops of these shoes were made from pieces of soft leather sewn together. This type of shoe—whether or not it used fur—was called a moccasin. Some Native American groups made and wore moccasins for thousands of years. Some moccasins were plain, and others were adorned with beadwork.

Section C

As the centuries passed, the primary material for shoes continued to be leather, and the process of making shoes did not change quickly. A wood and metal framework called a “last” was wrapped with pieces of leather that were then sewn together. As late as the mid-1800s, lasts were straight on both sides; this meant that there was no difference in shape between left and right shoes. It also meant that shoes were uncomfortable and that breaking them in was not easy. The lasts were made in different sizes, but for a long time only two widths were available—thin and stout.

For centuries, shoes were sewn by hand, just as they had been by the ancient Egyptians. Machines to assist shoemakers were not used until the rolling machine was invented in 1845. This device was used to pound pieces of leather into thin strips. About the same time, Elias Howe invented the sewing machine, and pieces of shoe leather could now be sewn together more quickly. Another inventor, Lyman Reed Blake, created a machine for sewing the soles of shoes to the upper parts. Because shoes could be made faster and more cheaply, people who had never owned shoes before could now afford to buy and wear them.

Section D

In Europe and North America during the seventeenth century, most people wore boots because they were practical. Even in many large cities, dirt roads were common, and people had to walk along muddy pathways and across streams. By the eighteenth century, however, more city streets were paved with cobblestones, and it was easier to keep shoes clean. Shoes became more decorative, and fancy buckles of gold and silver were often used. Most shoes worn in the United States throughout the nineteenth century were patterned after European styles.

The major change in shoes over the last century has been the use of materials other than leather. Humphrey O’Sullivan invented the first rubber heel for shoes in 1898. Rubber heels were popular because they lasted much longer than heels made of leather. The use of rubber soles came next. The first rubber-soled shoes were called plimsolls, and they were manufactured in the United States in the late 1800s.

The first American shoes made without leather were invented in 1917. The upper material was made of a flexible canvas. Those were the original “sneakers,” a word that was used because the rubber sole made the shoe very quiet, unlike most leather shoes, which often squeaked when people walked.

Many people today choose athletic shoes for casual wear, but not until the late 1970s were shoes designed with amateur athletes in mind. Shoes made of rubber and canvas were worn by tennis, volleyball, and basketball players. By the 1980s, companies began to design athletic shoes for specific sports, helping athletes perform better while protecting their feet and providing comfort.

Shoes have come a long way since the ancient Egyptians created their first sandals.

Many more types of materials are used, and shoes have never been more comfortable or supportive for feet. Even so, it is interesting that the basic sandal, crafted by people more than four thousand years ago, still has many similarities to shoes we wear today.

Questions 28 – 31

Look at the sections A – D. For which sections are the following headings true? Choose the correct number.

- 28. SECTION A
- 29. SECTION B
- 30. SECTION C
- 31. SECTION D

- 1. Shoes have come a long way
- 2. The first American shoes
- 3. New Trends, Materials, and Designs
- 4. The leather shoes
- 5. Shoes in Early Civilizations
- 6. Shoes for royalty
- 7. From Sandals to Sneakers Shoes Step Forward
- 8. The Shoemaking Process

Questions 32 - 36 Choose the correct answer.

32. What was the purpose of the first shoe?

- a) Comfortable
- b) Fashionable
- c) Functional
- d) Popularity

33. Which event happened first in the history of shoes?

- a) the making and wearing of moccasins
- b) the making and wearing of sandals
- c) the making and wearing of boots
- d) the making and wearing of sneakers

34. Which civilization was the first to wear shoes to make a fashion statement?

- a) Greek
- b) Roman
- c) Egyptian
- d) Persian

35. The First American shoes were made of which material

- a) leather
- b) flexible canvas
- c) grass

d) animal hide

36. What is the author's purpose in writing the passage?

- a) to inform about the first sneaker
- b) to inform about the history of moccasins
- c) to inform about ancient Greeks
- d) to inform about the history of shoes

Questions 37 - 40

Complete the sentences by using one or three words and/ or a number.

The first American Shoes were 37. _____

During 17th century, Europeans and North American mostly wore 38. _____

The word sneaker is used because the rubber sole shoes are 39. _____

In 1980s, companies made personalized 40. _____ shoes.

Reading Test 7

SECTION 1

You should spend about 20 minutes on Questions 1-12 which are based on Reading Passage 1

Architecture - Reaching for the Sky

Architecture is the art and science of designing buildings and structures. A building reflects the scientific and technological achievements of the age as well as the ideas and aspirations of the designer and client. The appearance of individual buildings, however, is often controversial.

The use of an architectural style cannot be said to start or finish on a specific date. Neither is it possible to say exactly what characterises a particular movement. But the origins of what is now generally known as modern architecture can be traced back to the social and technological changes of the 18th and 19th centuries.

Instead of using timber, stone and traditional building techniques, architects began to explore ways of creating buildings by using the latest technology and materials such as steel, glass and concrete strengthened steel bars, known as reinforced concrete. Technological advances also helped bring about the decline of rural industries and an increase in urban populations as people moved to the towns to work in the new factories. Such rapid and uncontrolled growth helped to turn parts of cities into slums.

By the 1920s architects throughout Europe were reacting against the conditions created by industrialisation. A new style of architecture emerged to reflect more idealistic notions for the future. It was made possible by new materials and construction techniques and was known as Modernism.

By the 1930s many buildings emerging from this movement were designed in the International Style. This was largely characterised by the bold use of new materials and simple, geometric forms, often with white walls supported by stilt-like pillars. These were stripped of unnecessary decoration that would detract from their primary purpose — to be used or lived in.

Walter Gropius, Charles Jeanneret (better known as Le Corbusier) and Ludwig Mies van der Rohe were among the most influential of the many architects who contributed to the development of Modernism in the first half of the century. But the economic depression of the 1930s and the second world war (1939-45) prevented their ideas from being widely realised until the economic conditions improved and war-torn cities had to be rebuilt. By the 1950s, the International Style had developed into a universal approach to building, which standardised the appearance of new buildings in cities across the world.

Unfortunately, this Modernist interest in geometric simplicity and function became exploited for profit. The rediscovery of quick-and-easy-to-handle reinforced concrete and an improved ability to prefabricate building sections meant that builders could meet the budgets of commissioning authorities and handle a renewed demand for development quickly and cheaply. But this led to many badly designed buildings, which discredited the original aims of Modernism.

Influenced by Le Corbusier's ideas on town planning, every large British city built multi-storey housing estates in the 1960s. Mass-produced, low-cost high-rises seemed to offer a solution to the problem of housing a growing inner-city population. But far from meeting human needs, the new estates often proved to be windswept deserts lacking essential social facilities and services. Many of these buildings were poorly designed and constructed and have since been demolished.

By the 1970s, a new respect for the place of buildings within the existing townscape arose. Preserving historic buildings or keeping only their facades (or fronts) grew common. Architects also began to make more use of building styles and materials that were traditional to the area. The architectural style usually referred to as High Tech was also emerging. It celebrated scientific and engineering achievements by openly parading the sophisticated techniques used in construction. Such buildings are commonly made of metal and glass; examples are Stansted airport and the Lloyd's building in London.

Disillusionment at the failure of many of the poor imitations of Modernist architecture led to interest in various styles and ideas from the past and present. By the 1980s the coexistence of different styles of architecture in the same building became known as Post Modern. Other architects looked back to the classical tradition. The trend in architecture now favours smaller scale building design that reflects a growing public awareness of environmental issues such as energy efficiency. Like the Modernists, people today recognise that a well designed environment improves the quality of life but is not necessarily achieved by adopting one well defined style of architecture.

Twentieth century architecture will mainly be remembered for its tall buildings. They have been made possible by the development of light steel frames and safe passenger lifts. They originated in the US over a century ago to help meet the demand for more economical use of land. As construction techniques improved, the skyscraper became a reality.

Questions 1-7

Complete the table below using information from Reading Passage .
Write **NO MORE THAN THREE WORDS** for each answer.
Write your answers in boxes **1-7** on your answer sheet.

PERIOD	STYLE OF PERIOD	BUILDING MATERIALS	CHARACTERISTICS
Before 18 th century	<i>Example</i> <u>traditional</u>	1 _____	
1920s	introduction of _____	2 steel, glass and concrete	exploration of latest technology
1930s - 1950s	3 _____		geometric forms
1960s	decline of Modernism	pre-fabricated sections	4 _____
1970s	end of Modernist era	traditional materials	5 _____ of historic buildings
1970s	beginning of _____ - era	6 _____ metal and glass	sophisticated techniques paraded
1980s	Postmodernism		7 _____

Questions 8-12

Reading Passage describes a number of cause and effect relationships. Match each Cause (8-12) in List A, with its Effect (A-H) in List B.

Write your answers (A-H) in boxes 9-12 on your answer sheet.

NB There are more effects in List B than you will need, so you will not use all of them. You may use any effect more than once if you wish.

List A CAUSES	List B EFFECTS
<p>8 ABCDEFGH A rapid movement of people from rural areas to cities is triggered by technological advance.</p> <p>9 ABCDEFGH Buildings become simple and functional.</p> <p>10 ABCDEFGH An economic depression and the second world war hit Europe.</p> <p>11 ABCDEFGH Multi-storey housing estates are built according to contemporary ideas on town planning.</p> <p>12 ABCDEFGH Less land must be used for building.</p>	<p>A The quality of life is improved.</p> <p>B Architecture reflects the age.</p> <p>C A number of these have been knocked down.</p> <p>D Light steel frames and lifts are developed.</p> <p>E Historical buildings are preserved.</p> <p>F All decoration is removed.</p> <p>G Parts of cities become slums.</p> <p>H Modernist ideas cannot be put into practice until the second half of the 20th century.</p>

SECTION 2

(A)

In the middle of Rome’s trendiest neighborhood, surrounded by sushi restaurants and nightclubs with names like Rodeo Steakhouse and Love Story, sits the ancient world’s biggest garbage dump—a 150-foot-tall mountain of discarded Roman amphoras, the shipping drums of the ancient world. It takes about 20 minutes to walk around Monte Testaccio, from the Latin *testa* and Italian *cocci*, both meaning “potsherd.” But despite its size—almost a mile in circumference—it’s easy to walk by and not really notice unless you are headed for some excellent pizza at *Velavevodetto*, a restaurant literally stuck into the mountain’s side. Most local residents don’t know what’s underneath the grass, dust, and scattering of trees. Monte Testaccio looks like a big hill, and in Rome people are accustomed to hills.

(B)

Although a garbage dump may lack the attraction of the Forum or Colosseum, I have come to Rome to meet the team excavating Monte Testaccio and to learn how scholars are using its evidence to understand the ancient Roman economy. As the modern global economy depends on light sweet crude, so too the ancient Romans depended on oil—olive oil. And for more than 250 years, from at least the first century A.D., an enormous number of amphoras filled with olive oil came by ship from the Roman provinces into the city itself, where they were unloaded, emptied, and then taken to Monte Testaccio and thrown away. In the absence of written records or literature on the subject, studying these amphoras is the best way to answer some of the most vexing questions concerning the Roman economy—How did it operate? How much control did the emperor exert over it? Which sectors were supported by the state and which operated in a free market environment or in the private sector?

(C)

Monte Testaccio stands near the Tiber River in what was ancient Rome’s commercial district. Many types of imported foodstuffs, including oil, were brought into the city and then stored for later distribution in the large warehouses that lined the river. So, professor, just how many amphoras are there?” I ask José Remesal of the University of Barcelona, co-director of the Monte Testaccio excavations. It’s the same question that must occur to everyone who visits the site when they realize that the crunching sounds their footsteps make are not from walking on fallen leaves, but on pieces of amphoras. (Don’t worry, even the small pieces are very sturdy.) Remesal replies in his deep baritone, “Something like 25 million complete ones. Of course, it’s difficult to be exact,” he adds with a typical Mediterranean shrug. I, for one, find it hard to believe that the whole mountain is made of amphoras without any soil or rubble. Seeing the incredulous look on my face as I peer down into a 10-foot-deep trench, Remesal says, “Yes, it’s really only amphoras.” I can’t imagine another site in the world where archaeologists find so much—about a ton of pottery every day. On most Mediterranean excavations, pottery washing is an activity

reserved for blisteringly hot afternoons when digging is impossible. Here, it is the only activity for most of Remesal's team, an international group of specialists and students from Spain and the United States. During each year's two-week field season, they wash and sort thousands of amphoras handles, bodies, shoulders, necks, and tops, counting and cataloguing, and always looking for stamped names, painted names, and numbers that tell each amphora's story.

(D)

Although scholars worked at Monte Testaccio beginning in the late 19th century, it's only within the past 30 years that they have embraced the role amphoras can play in understanding the nature of the Roman imperial economy. According to Remesal, the main challenge archaeologists and economic historians face is the lack of "serial documentation," that is, documents for consecutive years that reflect a true chronology. This is what makes Monte Testaccio a unique record of Roman commerce and provides a vast amount of datable evidence in a clear and unambiguous sequence. "There's no other place where you can study economic history, food production and distribution, and how the state controlled the transport of a product," Remesal says. "It's really remarkable."

Questions 13-16

Reading Passage 2 has four paragraphs **A-D**. Which paragraph contains what information?

Write the correct letter, **A-D**, in boxes **13-16** on your answer sheet.

- 13. Questions about the Roman economy _____
- 14. A unique feature _____
- 15. Description of the dump _____
- 16. Dialogue with a professor _____

Questions 17–21

Do the following statements agree with the information given in Reading Passage 2? In boxes **17–21** on your answer sheet, write

- TRUE** if the statement agrees with the information
- FALSE** if the statement contradicts the information
- NOT GIVEN** if there is no information on this

- 17. World's biggest garbage dump is surrounded by restaurants and nightclubs.
- 18. The garbage dump is as popular as the Colosseum in Rome.
- 19. Ancient Roman economy depended on oil.
- 20. There is no information on how many amphoras are there.
- 21. Remesal says that Monte Testaccio is a great place to study economics.

Questions 22–26

Complete the sentences below.

Write **NO MORE THAN THREE WORDS** from the passage for each answer.

Write your answers in boxes **22–26** on your answer sheet.

22. It is unknown for... what's underneath the grass, dust, and scattering of trees.

23. Monte Testaccio stands near the ancient Rome's

24. Remesal doesn't believe that the whole mountain is made ofwithout any soil or rubble.

25. Remesal's team washes and sorts thousands of amphoras each year's two-week

26 started working at Monte Testaccio in the late 19th century.

SECTION 3

You should spend about 20 minutes on Questions 27-40, which are based on Reading Passage 3 below.

Mystery in Easter Island!

A

One of the world's most famous yet least visited archaeological sites, Easter Island is a small, hilly, now treeless island of volcanic origin. Located in the Pacific Ocean at 27 degrees south of the equator and some 2200 miles (3600 kilometers) off the coast of Chile, it is considered to be the world's most remote inhabited island. The island is, technically speaking, a single massive volcano rising over ten thousand feet from the Pacific Ocean floor. The island received its most well-known current name, Easter Island, from the Dutch sea captain Jacob Roggeveen who became the first European to visit Easter Sunday, April 5, 1722.

B

In the early 1950s, the Norwegian explorer Thor Heyerdahl popularized the idea that the island had been originally settled by advanced societies of Indians from the coast of South America. Extensive archaeological, ethnographic and linguistic research has conclusively shown this hypothesis to be inaccurate. It is now recognized that the original inhabitants of Easter Island are of Polynesian stock (DNA extracts from skeletons have confirmed this), that they most probably came from the Marquesas or Society islands, and that they arrived as early as 318 AD (carbon dating of reeds from a grave confirms this). At the time of their arrival, much of the island was forested, was teeming with land birds, and was perhaps the most productive breeding site for seabirds in the Polynesia region. Because of the plentiful bird, fish and plant food sources, the human population grew and gave rise to a rich religious and artistic culture.

C

That culture's most famous features are its enormous stone statues called moai, at least 288 of which once stood upon massive stone platforms called **ahu**. There are some 250 of these **ahu** platforms spaced approximately one-half mile apart and creating an almost unbroken line around the perimeter of the island. Another 600 moai statues, in various stages of completion, are scattered around the island, either in quarries or along ancient roads between the quarries and the coastal areas where the statues were most often erected. Nearly all the moai are carved from the tough stone of the **Rano Raraku** volcano. The average statue is 14 feet and 6 inches tall and weighs 14 tons. Some moai were as large as 33 feet and weighed more than 80 tons. Depending upon the size of the statues, it has been estimated that between 50 and 150 people were needed to drag them across the countryside on sledges and rollers made from the island's trees.

D

Scholars are unable to definitively explain the function and use of the moai statues. It is assumed that their carving and erection derived from an idea rooted in similar practices found elsewhere in Polynesia but which evolved in a unique way on Easter Island. Archaeological and iconographic analysis indicates that the statue cult was based on an ideology of male, lineage-based authority incorporating anthropomorphic symbolism. The statues were thus symbols of authority and power, both religious and political. But they were not only symbols. To the people who erected and used them, they were actual repositories of sacred spirit. Carved stone and wooden objects in ancient Polynesian religions, when properly fashioned and ritually prepared, were believed to be charged by a magical spiritual essence called *mana*. The ahu platforms of Easter Island were the sanctuaries of the people, and the moai statues were the ritually charged sacred objects of those sanctuaries.

E

Besides its more well-known name, Easter Island is also known as *Te-Pito-O-Te-Henuab*, meaning 'The Navel of the World', and as *Mata-Ki-Te-Rani*, meaning 'Eyes Looking at Heaven'. These ancient name and a host of mythological details ignored by mainstream archaeologists point to the possibility that the remote island may once have been a geodetic marker and the site of an astronomical observatory of a long-forgotten civilization. In his book, *Heaven's Mirror*, Graham Hancock suggests that Easter Island may once have been a significant scientific outpost of this antediluvian civilization and that its location had extreme importance in a planet-spanning, mathematically precise grid of sacred sites. Two other alternative scholars, Christopher Knight and Robert Lomas, have extensively studied the location and possible function of these geodetic markers. In their fascinating book, *Uriel's Machine*, they suggest that one purpose of the geodetic markers was as part of a global network of sophisticated astronomical observatories dedicated to predicting and preparing for future commentary impacts and crystal displacement cataclysms.

F

In the latter years of the 20th century and the first years of the 21st century, various writers and scientists have advanced theories regarding the rapid decline of Easter Island's magnificent civilization around the time of the first European contact. Principal among these theories, and now shown to be inaccurate, is that postulated by Jared Diamond in his book *Collapse: How Societies Choose to Fail or Survive*. Basically, these theories state that a few centuries after Easter Island's initial colonization the resource needs of the growing population had begun to outpace the island's capacity to renew itself ecologically. By the 1400s the forests had been entirely cut, the rich ground cover had eroded away, the springs had dried up, and the vast flocks of birds coming to roost on the island had disappeared. With no logs to build canoes for offshore fishing, with depleted bird and wildlife food sources, and with declining crop yields because of the erosion of good soil, the nutritional intake of the people plummeted. First famine, then cannibalism, set in. Because the island could no longer feed the chiefs, bureaucrats and priests who kept the complex society running, the resulting chaos triggered a social and cultural collapse. By 1700 the population dropped to between one-quarter and one-tenth of its

former number, and many of the statues were toppled during supposed “clan wars” of the 1600 and 1700s.

G

The faulty notions presented in these theories began with the racist assumptions of Thor Heyerdahl and have been perpetuated by writers, such as Jared Diamond, who do not have sufficient archaeological and historical understanding of the actual events which occurred on Easter Island. The real truth regarding the tremendous social devastation which occurred on Easter Island is that it was a direct consequence of the inhumane behaviour of many of the first European visitors, particularly the slavers who raped and murdered the islanders, introduced smallpox and other diseases, and brutally removed the natives to mainland South America.

Questions 27-30

The reading passage has seven paragraphs, **A-G**

Choose the correct heading for paragraphs **A-G** from the list below.

Write the correct number, i-xi, in boxes 27-30 on your answer sheet.

NB *There are more headings than paragraphs*

List of headings

- i** The famous moai
- ii** The status represented symbols of combined purposes
- iii** The ancient spots which indicate the scientific application
- iv** The story of the name
- v** Early immigrants, rise and prosperity
- vi** The geology of Easter Island
- vii** The begin of Thor Heyerdahl’s discovery
- viii** The countering explanation to the misconceptions politically manipulated
- ix** Symbols of authority and power
- x** The Navel of the World
- xi** The Norwegian Invaders’ legacy

Example: Paragraph A iv

27. Paragraph **B**

Example: Paragraph C i

28. Paragraph **D**

29. Paragraph **E**

30. Paragraph **G**

Questions 31-36

Do the following statements agree with the information given in Reading Passage 3?

In boxes 31-36 on your answer sheet write

TRUE if the statement is true

FALSE if the statement is false

NOT GIVEN if the information is not given in the passage

- 31. The first inhabitants of Easter Island are Polynesian, from the Marquesas or Society islands.
- 32. Construction of some moai statues on the island was not finished.
- 33. The Moai can be found not only on Easter Island but also elsewhere in Polynesia.
- 34. Most archaeologists recognised the religious and astronomical functions for an ancient society.
- 35. The structures of Easter Island work as an astronomical outpost for extraterrestrial visitors.
- 36. the theory that depleted natural resources leading to the fall of Easter Island actual have a distorted perspective

Questions 37-40

Complete the following summary of the paragraphs of Reading Passage

Using **NO MORE THAN THREE WORDS** from the Reading Passage for each answer.
Write your answers in boxes 37-40 on your answer sheet.

Many theories speculated that Easter Island’s fall around the era of the initial European contact. Some say the resources are depleted by a **37**.....; The erroneous theories began with a root of the **38**.....advanced by some scholars. Early writers did not have adequate **39**..... understandings to comprehend the true nature of events on the island. The social devastation was, in fact, a direct result of **40** of the first European settlers.

Reading Test 8

SECTION 1

You should spend about 20 minutes on Questions 1-13 which are based on Reading Passage 1

CAN WE BELIEVE OUR OWN EYES?

A.

An optical illusion refers to a visually perceived image that is deceptive or misleading in that information transmitted from the eye to the brain is processed in a way that the related assumption or deduction does not represent the true physical reality. Our perceptions of what we think we see can be influenced by a number of external factors; 'illusions' can be classified into two main categories these being 'physiological illusions' and 'cognitive' illusions, the latter category can then be divided again into four sub-types.

B.

Physiological illusions occur as a result of excessive stimulation of the eyes and brain which leads to a temporary state of confusion and mixed messages. For example, after exposure to extremely vivid lights, the eyes may need time to adapt and immediately after the stimulus, we may see things that would not be the norm. In the same way a contingent perceptual after-effect may be experienced after staring at a particular colour and the receptors in the brain may process subsequent colours inaccurately until overload has passed.

C.

Cognitive illusions, on the other hand, are said to arise not as a result of neurone activity as with the aforementioned category, but due to assumptions we may consciously make based on our knowledge and experience of the world. The four categories of cognitive illusion are 'ambiguous' illusions, 'distorting' illusions 'paradox' illusions and 'fictional' illusions. Inclusion of 'fictional' illusions into the cognitive group is somewhat misleading; however, as this type of illusion is unique in that it is only seen by an individual in a given situation and exists in no tangible form. A fictional illusion is in reality a hallucination which arises as a result of drug use or a brain condition such as schizophrenia.

D.

Ambiguous illusions are pictures or objects which are structured in such a way that alternative perceptions of their structure are possible. Different individuals may instantly perceive the object or picture in a different way than another and, in fact, the same individual is often able to see and interpret the image or object in more than one form. A classic example of an ambiguous illusion is the Necker cube. This cube is a standard line

drawing which our visual senses generally interpret as a three dimensional box. When the lines of the box cross, the picture intentionally does not define which is in front and which is behind. However, when individuals view the box, it is the automatic response of the mind to interpret what is seen. Generally our thought process patterns work in the way that we view objects from above; for this reason, when most people look at the Necker Cube they will interpret the lower left face as being the front of the box, the base of the front face being parallel to the floor as their thought processes convert the image to three dimensions. However, it is also possible to interpret the image differently in that the front of the box could also be seen to be in a different position.

E.

The Necker Cube made contributions to researchers' understanding of the human visual system, providing evidence that the brain is a neural network with two distinct and interchangeable states. It has also been used in epistemology – the study of knowledge – as evidence to disprove the theory upheld by 'direct realism' that the way the human mind perceives the world is the way the world actually is. To illustrate, with the Necker cube we are generally able to see one or both versions of a three dimensional cube, when in fact only a two dimensional drawing comprised of 12 lines exists.

F.

Distorting illusions affect an individual's ability to judge size, length, or curvature; the Muller-Lyer illusion which consists of three lines with arrow-like endings is a prime example. In this illusion the middle arrow has both arrow ends pointing out, while the line above it has arrow ends pointing in and the third and final line possesses one inward pointing and one outward pointing arrow end. Most respondents from certain backgrounds generally respond that the middle arrow is the longest (though all are in fact the same). However, cultural backgrounds affect perceptions related to this illusion; international research having shown that non-Western subjects, particularly those generally not exposed to rectangular shaped buildings and door frames in their day to day life, are less likely to misinterpret the true length of the three drawings.

G.

Paradox illusions encourage the mind to believe that we are seeing something we know to be impossible. The Penrose Stairs and the Penrose Triangle, developed by Lionel Penrose are examples of models created to illustrate this phenomenon. Many naturally occurring optical illusions also exist. Throughout the world there are a number of locations where objects can be perceived to roll uphill; our cognitive and pre-learned knowledge inform us that this is impossible; however information received by the visual senses of observers creates conflict. These areas are often known as 'gravity hills' or 'magnetic' hills and are often popular with tourists; the mystical properties of the area are often promoted vigorously to add mystique or claimed to arise as a result of the special properties and magnetic influence of the area's land.

H.

The scientific explanation for such phenomenon is that such areas are set on slightly sloping ground without a visible horizon against which to establish perspective. In addition, surrounding points of reference we would generally expect to be perpendicular, such as trees, are in fact on a slope. The interpretation of what observers believe they are experiencing is therefore confused, downward slopes may be perceived to be horizontal or tilting upwards and cars with hand brakes released on such ground appear to roll upwards when in fact they are rolling, as gravity dictates, in a downhill direction. While our innate sense of balance under normal situations helps us determine the inclination of the ground, interference from the visual stimuli as outlined above and lack of reference from points on the horizon can override this ability in such situations, especially if the gradient is gentle.

Questions 1-3

Answer the questions below.

Choose **NO MORE THAN THREE WORDS** from the passage for each answer.

Write your answers in boxes **1-3** on your answer sheet.

1. What type of illusion is a result of interference with neurone activity?
2. Which two factors influence the way we process information on a cognitive level?
3. Which theory holds that individuals see only the true reality of a situation?

Questions 4-8

According to the information in Reading Passage, classify the following as relating to

- A. Fictional illusions
- B. Paradox illusions
- C. Distorting illusions
- D. Ambiguous illusions

Write the correct letter **A-D** in boxes **4-8** on your answer sheet.

4. may be perceived differently by individuals of diverse ethnic origin
5. may override our natural ability to make rational judgement
6. may be interpreted differently even by the same subject
7. may result due to chemical stimulation
8. has been used to question the validity of arguments in a different field

Questions 9-13

Choose the correct letter, **A, B, C or D**.

Write your answers in boxes **21-25** on your answer sheet.

9. Fictional illusions

- A** may eventually lead to schizophrenia.
- B** are the only type which are completely subjective.
- C** are very similar to paradox illusions.
- D** are typical of cognitive illusions.

10. According to ambiguous illusion theory, which face of the Necker Cube is interpreted to be the front of the box due to the general tendency to view objects from above?

- A
- B
- C

11. Which diagram represents the Muller-Lyer illusion?

- A
- B
- C

12. The Penrose Stairs are an example of a model which

- A can persuade the viewer they are seeing something infeasible.
- B has disproven established theories on knowledge.
- C is a naturally occurring paradox illusion.
- D can be seen in a number of international locations.

13. Occurrences on 'gravity' or 'magnetic' hills result due to

- A** the mineral content of soil in the area.
- B** factors currently unexplained from a scientific perspective.
- C** misleading natural points of reference.
- D** rising slopes being misinterpreted as on a decline.

SECTION 2

You should spend about 20 minutes on Questions 14-26, which are based on Reading Passage 2 below.

Children's Literature

A.

Stories and poems aimed at children have an exceedingly long history: lullabies, for example, were sung in Roman times, and a few nursery games and rhymes are almost as ancient. Yet so far as written-down literature is concerned, while there were stories in print before 1700 that children often seized on when they had the chance, such as translations of Aesop's fables, fairy-stories and popular ballads and romances, these were not aimed at young people in particular. Since the only genuinely child-oriented literature at this time would have been a few instructional works to help with reading and general knowledge, plus the odd Puritanical tract as an aid to morality, the only course for keen child readers was to read adult literature. This still occurs today, especially with adult thrillers or romances that include more exciting, graphic detail than is normally found in the literature for younger readers.

B.

By the middle of the 18th century there were enough eager child readers, and enough parents glad to cater to this interest, for publishers to specialize in children's books whose first aim was pleasure rather than education or morality. In Britain, a London merchant named Thomas Boreham produced *Cajanus, The Swedish Giant* in 1742, while the more famous John Newbery published *A Little Pretty Pocket Book* in 1744. Its contents - rhymes, stories, children's games plus a free gift ('A ball and a pincushion')—in many ways anticipated the similar lucky-dip contents of children's annuals this century. It is a tribute to Newbery's flair that he hit upon a winning formula quite so quickly, to be pirated almost immediately in America.

C.

Such pleasing levity was not to last. Influenced by Rousseau, whose *Emile* (1762) decreed that all books for children save *Robinson Crusoe* were a dangerous diversion, contemporary critics saw to it that children's literature should be instructive and uplifting. Prominent among such voices was Mrs. Sarah Trimmer, whose magazine *The Guardian of Education* (1802) carried the first regular reviews of children's books. It was she who condemned fairy-tales for their violence and general absurdity; her own stories, *Fabulous Histories* (1786) described talking animals who were always models of sense and decorum.

D.

So the moral story for children was always threatened from within, given the way children

have of drawing out entertainment from the sternest moralist. But the greatest blow to the improving children's book was to come from an unlikely source indeed: early 19th-century interest in folklore. Both nursery rhymes, selected by James Orchard Halliwell for a folklore society in 1842, and collection of fairy-stories by the scholarly Grimm brothers, swiftly translated into English in 1823, soon rocket to popularity with the young, quickly leading to new editions, each one more child-centered than the last. From now on younger children could expect stories written for their particular interest and with the needs of their own limited experience of life kept well to the fore.

What eventually determined the reading of older children was often not the availability of special children's literature as such but access to books that contained characters, such as young people or animals, with whom they could more easily empathize, or action, such as exploring or fighting, that made few demands on adult maturity or understanding.

E.

The final apotheosis of literary childhood as something to be protected from unpleasant reality came with the arrival in the late 1930s of child-centered best-sellers intent on entertainment at its most escapist. In Britain novelist such as Enid Blyton and Richmal Crompton described children who were always free to have the most unlikely adventures, secure in the knowledge that nothing bad could ever happen to them in the end. The fact that war broke out again during her books' greatest popularity fails to register at all in the self-enclosed world inhabited by Enid Blyton's young characters. Reaction against such dream-worlds was inevitable after World War II, coinciding with the growth of paperback sales, children's libraries and a new spirit of moral and social concern. Urged on by committed publishers and progressive librarians, writers slowly began to explore new areas of interest while also shifting the settings of their plots from the middle-class world to which their chiefly adult patrons had always previously belonged.

F.

Critical emphasis, during this development, has been divided. For some, the most important task was to rid children's books of the social prejudice and exclusiveness no longer found acceptable. Others concentrated more on the positive achievements of contemporary children's literature. That writers of these works are now often recommended to the attentions of adult as well as child readers echoes the 19th-century belief that children's literature can be shared by the generations, rather than being a defensive barrier between childhood and the necessary growth towards adult understanding.

Questions 14-18

Complete the table below.

Choose **NO MORE THAN TWO WORDS** from Reading Passage 2 for each answer.

Write your answers in boxes **14-18** on your answer sheet.

DATE	FEATURES	AIM	EXAMPLE
Before 1700	Not aimed at young children	Education and morality	and Puritanical tract
By the middle of 18th century	Collection of and games	14 Read for pleasure	A Little Pretty Pocket Book (exported to 15)
Early 19th century	Growing interest in	16 To be more children-centered	Nursery rhymes and 17
Late 1930s	Stories of harm-free 18	Entertainment	Enid Blyton and Richmal Crompton's novels

Questions 19-21

Look at the following people and the list of statements below.

Match each person with the correct statement.

Write the correct letter **A-E** in boxes **19-21** on your answer sheet.

List of statements

- A. Wrote criticisms of children's literature
- B. Used animals to demonstrate the absurdity of fairy tales
- C. Was not a writer originally
- D. Translated a book into English
- E. Didn't write in the English language

19. Thomas Boreham

20. Mrs. Sarah trimmer

21. Grimm Brothers

Questions 22-26

Do the following statements agree with the information given in Reading Passage 268?

In boxes **22-26** on your answer sheet write

TRUE if the statement agrees with the information

FALSE if the statement contradicts the information

NOT GIVEN if there is no information on this

22. Children didn't start to read books until 1700.

23. Sarah Trimmer believed that children's books should set good examples.

24. Parents were concerned about the violence in children's books.

25. An interest in the folklore changed the direction of the development of children's books.

26. Today children's book writers believe their works should appeal to both children and adults.

SECTION 3

You should spend about 20 minutes on Questions 27-40, which are based on Reading Passage 3 below.

Soviet's New Working Week

Historian investigates how Stalin changed the calendar to keep the Soviet people continually at work

A.

“There are no fortresses that Bolsheviks cannot storm”. With these words, Stalin expressed the dynamic self-confidence of the Soviet Union’s Five Year Plan: weak and backward Russia was to turn overnight into a powerful modern industrial country. Between 1928 and 1932, production of coal, iron and steel increased at a fantastic rate, and new industrial cities sprang up, along with the world’s biggest dam. Everyone’s life was affected, as collectivised farming drove millions from the land to swell the industrial proletariat. Private enterprise disappeared in city and country, leaving the State supreme under the dictatorship of Stalin. Unlimited enthusiasm was the mood of the day, with the Communists believing that iron will and hard-working manpower alone would bring about a new world.

B.

Enthusiasm spread to time itself, in the desire to make the state a huge efficient machine, where not a moment would be wasted, especially in the workplace. Lenin had already been intrigued by the ideas of the American Frederick Winslow Taylor (1856-1915), whose time-motion studies had discovered ways of stream-lining effort so that every worker could produce the maximum. The Bolsheviks were also great admirers of Henry Ford’s assembly line mass production and of his Fordson tractors that were imported by the thousands. The engineers who came with them to train their users helped spread what became a real cult of Ford. Emulating and surpassing such capitalist models formed part of the training of the new Soviet Man, a heroic figure whose unlimited capacity for work would benefit everyone in the dynamic new society. All this culminated in the Plan, which has been characterized as the triumph of the machine, where workers would become supremely efficient robot-like creatures.

C.

Yet this was Communism whose goals had always included improving the lives of the proletariat. One major step in that direction was the sudden announcement in 1927 that reduced the working day from eight to seven hours. In January 1929, all Industries were ordered to adopt the shorter day by the end of the Plan. Workers were also to have an extra hour off on the eve of Sundays and holidays. Typically though, the state took away more than it gave, for this was part of a scheme to increase production by establishing a three-shift system. This meant that the factories were open day and night and that many had to work at highly undesirable hours.

D.

Hardly had that policy been announced, though, then Yuri Larin, who had been a close associate of Lenin and architect of his radical economic policy, came up with an idea for even greater efficiency. Workers were free and plants were closed on Sundays. Why not abolish that wasted day by instituting a continuous workweek so that the machines could operate to their full capacity every day of the week? When Larin presented his ideas to the Congress of Soviets in May 1929, no one paid much attention. Soon after, though, he got the ear of Stalin, who approved. Suddenly, in June, the Soviet press was filled with articles praising the new scheme. In August, the Council of Peoples' Commissars ordered that the continuous workweek be brought into immediate effect, during the height of enthusiasm for the Plan, whose goals the new schedule seemed guaranteed to forward.

E.

The idea seemed simple enough but turned out to be very complicated in practice. Obviously, the workers couldn't be made to work seven days a week, nor should their total work hours be increased. The solution was ingenious: a new five-day week would have the workers on the job for four days, with the fifth day free; holidays would be reduced from ten to five, and the extra hour off on the eve of rest days would be abolished. Staggering the rest-days between groups of workers meant that each worker would spend the same number of hours on the job, but the factories would be working a full 360 days a year instead of 300. The 360 divided neatly into 72 five-day weeks. Workers in each establishment (at first factories, then stores and offices) were divided into five groups, each assigned a colour which appeared on the new Uninterrupted Work Week calendars distributed all over the country. Colour-coding was a valuable mnemonic device since workers might have trouble remembering what their day off was going to be, for it would change every week. A glance at the colour on the calendar would reveal the free day, and allow workers to plan their activities. This system, however, did not apply to construction or seasonal occupations, which followed a six-day week, or to factories or mines which had to close regularly for maintenance: they also had a six-day week, whether interrupted (with the same day off for everyone) or continuous. In all cases, though, Sunday was treated like any other day.

F.

Official propaganda touted the material and cultural benefits of the new scheme. Workers would get more rest; production and employment would increase (for more workers would be needed to keep the factories running continuously); the standard of living would improve. Leisure time would be more rationally employed, for cultural activities (theatre, clubs, sports) would no longer have to be crammed into a weekend, but could flourish every day, with their facilities far less crowded. Shopping would be easier for the same reasons. Ignorance and superstition, as represented by organized religion, would suffer a mortal blow, since 80 per cent of the workers would be on the job on any given Sunday. The only objection concerned the family, where normally more than one member was working: well, the Soviets insisted, the narrow family was far less important than the vast common good and besides, arrangements could be made for husband and wife to share

a common schedule. In fact, the regime had long wanted to weaken or sideline the two greatest potential threats to its total dominance: organised religion and the nuclear family. Religion succumbed, but the family, as even Stalin finally had to admit, proved much more resistant.

G.

The continuous work week, hailed as a Utopia where time itself was conquered and the sluggish Sunday abolished forever, spread like an epidemic. According to official figures, 63 per cent of industrial workers were so employed by April 1930; in June, all industry was ordered to convert during the next year. The fad reached its peak in October when it affected 73 per cent of workers. In fact, many managers simply claimed that their factories had gone over to the new week, without actually applying it. Conforming to the demands of the Plan was important; practical matters could wait. By then, though, problems were becoming obvious. Most serious (though never officially admitted), the workers hated it. Coordination of family schedules was virtually impossible and usually ignored, so husbands and wives only saw each other before or after work; rest days were empty without any loved ones to share them – even friends were likely to be on a different schedule. Confusion reigned: the new plan was introduced haphazardly, with some factories operating five-, six- and seven-day weeks at the same time, and the workers often not getting their rest days at all.

H.

The Soviet government might have ignored all that (It didn't depend on public approval), but the new week was far from having the vaunted effect on production. With the complicated rotation system, the work teams necessarily found themselves doing different kinds of work in successive weeks. Machines, no longer consistently in the hands of people who knew how to tend them, were often poorly maintained or even broken. Workers lost a sense of responsibility for the special tasks they had normally performed.

I.

As a result, the new week started to lose ground. Stalin's speech of June 1931, which criticised the "depersonalised labor" its too hasty application had brought, marked the beginning of the end. In November, the government ordered the widespread adoption of the six-day week, which had its own calendar, with regular breaks on the 6th, 12th, 18th, 24th, and 30th, with Sunday usually as a working day. By July 1935, only 26 per cent of workers still followed the continuous schedule, and the six-day week was soon on its way out. Finally, in 1940, as part of the general reversion to more traditional methods, both the continuous five-day week and the novel six-day week were abandoned, and Sunday returned as the universal day of rest. A bold but typically ill-conceived experiment was at an end.

Questions 27-34

Reading Passage 3 has nine paragraphs **A-I**

Choose the correct heading for each paragraph from the list of headings below.
Write the correct number i-xii in boxes 27-34 on your answer sheet

List of Headings

- i Benefits of the new scheme and its resistance
- ii Making use of the once wasted weekends
- iii Cutting work hours for better efficiency
- iv Optimism of the great future
- v Negative effects on the production itself
- vi Soviet Union's five-year plan
- vii The abolishment of the new work-week scheme
- viii The Ford model
- ix Reaction from factory workers and their families
- x The color-coding scheme
- xi Establishing a three-shift system
- xii Foreign inspiration

27. Paragraph A

28. Paragraph B

<i>Example</i>	<i>Answer</i>
Paragraph C	iii

29. Paragraph D

30. Paragraph E

31. Paragraph F

32. Paragraph G

33. Paragraph H

34. Paragraph I

Questions 35-37

Choose the correct letter **A, B, C** or **D**.

Write your answers in boxes 35-37 on your answer sheet.

35. According to paragraph A, the Soviet's five-year plan was a success because A

- A Bolsheviks built a strong fortress.
- B Russia was weak and backward.
- C industrial production increased.
- D Stalin was confident about the Soviet's potential.

36. Daily working hours were cut from eight to seven to

- A improve the lives of all people
- B boost industrial productivity.
- C get rid of undesirable work hours.
- D change the already establish three-shift work system.

37. Many factory managers claimed to have complied with the demands of the new work week because

- A they were pressurized by the state to do so.
- B they believed there would not be any practical problems.
- C they were able to apply it.
- D workers hated the new plan.

Questions 38-40

Answer the questions below using **NO MORE THAN TWO WORDS** from the passage for each answer.

Write your answers in boxes 38-40 on your answer sheet.

- 38** Whose ideas of continuous work week did Stalin approve and helped to implement?
- 39** What method was used to help workers to remember the rotation of their off days?
- 40** What was the most resistant force to the new work week scheme?

Reading Test 9

SECTION 1

You should spend about 20 minutes on Questions 1-13 which are based on Reading Passage 1

Man or Machine

A

During July 2003, the Museum of Science in Cambridge, Massachusetts exhibited what Honda calls 'the world's most advanced humanoid robot', ASIMO (the Advanced Step in Innovative Mobility). Honda's brainchild is on tour in North America and delighting audiences wherever it goes. After 17 years in the making, ASIMO stands at four feet tall, weighs around 115 pounds and looks like a child in an astronaut's suit. Though it is difficult to see ASIMO's face at a distance, on closer inspection it has a smile and two large 'eyes' that conceal cameras. The robot cannot work autonomously – its actions are 'remote-controlled' by scientist through the computer in its backpack. Yet watching ASIMO perform at a show in Massachusetts it seemed uncannily human. The audience cheered as ASIMO walked forwards and backwards, side to side and up and downstairs. After the show, a number of people told me that they would like robots to play more of a role in daily life – one even said that the robot would be like 'another person'.

B

While the Japanese have made huge strides in solving some of the engineering problems of human kinetics and bipedal movements, for the past 10 years scientists at MIT's former Artificial Intelligence (AI) lab (recently renamed the Computer Science and Artificial Intelligence Laboratory, CSAIL) have been making robots that can behave like humans and interact with humans. One of MIT's robots, Kismet, is an anthropomorphic head and has two eyes (complete with eyelids), ears, a mouth, and eyebrows. It has several facial expressions, including happy, sad, frightened and disgusted. Human interlocutors are able to read some of the robot's facial expressions, and often change their behavior towards the machine as a result – for example, playing with it when it appears 'sad'. Kismet is now in MIT's museum, but the ideas developed here continue to be explored in new robots.

C

Cog (short for Cognition) is another pioneering project from MIT's former AI lab. Cog has a head, eyes, two arms, hands and a torso – and its proportions were originally measured from the body of a researcher in the lab. The work on Cog has been used to test theories of embodiment and developmental robotics, particularly getting a robot to develop intelligence by responding to its environment via sensors, and to learn through these types of interactions.

D

MIT is getting furthest down the road to creating human-like and interactive robots. Some scientists argue that ASIMO is a great engineering feat but not an intelligent machine – because it is unable to interact autonomously with unpredictabilities in its environment in meaningful ways, and learn from experience. Robots like Cog and Kismet and new robots at MIT's CSAIL and media lab, however, are beginning to do this.

E

These are exciting developments. Creating a machine that can walk, make gestures and learn from its environment is an amazing achievement. And watch this space: these achievements are likely rapidly to be improved upon. Humanoid robots could have a plethora of uses in society, helping to free people from everyday tasks. In Japan, for example, there is an aim to create robots that can do the tasks similar to an average human and also act in more sophisticated situations as firefighters, astronauts or medical assistants to the elderly in the workplace and in homes – partly in order to counterbalance the effects of an ageing population.

F

Such robots say much about the way in which we view humanity, and they bring out the best and worst of us. On one hand, these developments express human creativity – our ability to invent, experiment, and to extend our control over the world. On the other hand, the aim to create a robot like a human being is spurred on by dehumanized ideas – by the sense that human companionship can be substituted by machines; that humans lose their humanity when they interact with technology; or that we a little more than surface and ritual behaviors, that can be simulated with metal and electrical circuits.

Questions 1-6

Reading passage 1 has six paragraphs, **A-F**.

Which paragraph contains the following information?

Write the correct letter, **A-F**, in boxes **1-6** on your answer sheet.

NB You may use any letter more than once

1. different ways of using robots
2. a robot whose body has the same proportion as that of an adult
3. the fact that human can be copied and replaced by robots
4. a comparison between ASIMO for Honda and other robots
5. the pros and cons of creating robots
6. a robot that has eyebrows

Questions 7-13

Complete the following summary of the paragraphs of Reading Passage 1.

Using **NO MORE THAN TWO WORDS** from the Reading Passage for each answer.

Write your answers in boxes **7-13** on your answer sheet.

In 2003, Massachusetts displayed a robot named ASIMO which was invented by Honda, after a period of **7**.....in the making. The operating information is stored in the computer in its **8**..... so that scientists can control **ASIMO's** movement. While Japan is making great progress, MIT is developing robots that are human-like and can **9**.....Humans. What is special about Kismet is that it has different **10**..... which can be read by human interlocutors. **11**.....is another robot from MIT, whose body's proportion is the same as an adult. By responding to the surroundings through **12**....., it could develop its **13**.....

SECTION 2

You should spend about 20 minutes on Questions 14-26 which are based on Reading Passage 2

How to Reduce Employee Turnover

A.

The chief executive of a large hotel became aware that his company was experiencing an annual employee turnover of about 60 per cent, at an annual cost estimated between \$10 to \$15 million. This large amount of money was calculated based on three factors: the money spent hiring and training replacements; the cost to the business in lower productivity due to employees becoming familiar with the requirements of their new job; and reduced occupancy rates, due to poor guest satisfaction levels.

B.

The Chief Executive knew that in order to save his company, he had to reduce the high turnover costs. Making up for the lost income due to turnover is not an easy task and many companies have not declared war on unwanted employee turnover because they have not taken the time to work out the costs of lost revenues and productivity. But the hotel boss decided to tackle the issue head-on by implementing a 4 point plan, the hotel first took the time to calculate their turnover costs; secondly to evaluate the main causes for the staff turnover and; thirdly to discuss some of the solutions to the problems and lastly to prioritize actions and evaluate future returns following implemented changes.

C.

Within a two-year period, the results were significant. The annual employee turnover was reduced by 78 per cent and this impacted downtime due to training and guest satisfaction. The result was a \$10 million savings for the company. Because most do not know the root causes of employee turnover and costs have often not been accurately estimated, causes are usually not known. As a result, solutions are commonly not targeted at a company's individual, specific causes. The following is an examination of what the Chief Executive did to turn the hotel around.

D.

Two factors were considered in relation to the calculation of costs: those departments who had the highest rates of turnover and those whose turnover had the greatest potential effect on profit. After some investigation, it was shown that some of the positions with the highest turnover rates such as cleaners and gardeners did not carry with them high associated costs. In fact, what was revealed was that only 6 per cent of employees accounted for 43 per cent of the turnover. Positions that involved a substantial amount of time in training were the ones that attracted the highest costing. The analysis revealed that those positions within the hotel which had the greatest impact on profit were people

like the front office receptionists and those working in accounts.

E.

As unusual as it may sound, it is now a common understanding that offering employees more money is not necessarily a good solution to high employee turnover – often they leave because they simply dislike the work. Therefore, it was important to tackle the analysis from the perspective of what were the chief causes for staff leaving. A holistic approach was undertaken and several key findings emerged. The hotel found that fundamentally they adopted poor recruiting and selection practices. For example, it was shown that almost 35 per cent of the cleaning staff left after the first week and a further 25% during the first month. Candidates were being over-sold the job by recruiters and left soon after they encountered unrealistic job expectations.

F.

Devising solutions to these issues was the other half of the equation. As far a recruiting was concerned, they changed their approach by getting personnel from the hotel to handle it. Once this change was made, the attrition rates decreased substantially. To add to employee motivation, new staff were made aware of the mission and goals of the organization and how they would be paid above industry standard for striving to attain hotel values. New staff were shown where the hotel was heading and how they would have a guaranteed, stable employment situation with a major force in the hotel industry’ – it was even suggested that after a period of employment, new staff might be given the opportunity to contribute to organizational goal setting.

G.

They had been losing many of their employees during the first month or two of employment, so they made new staff aware that bonuses would be offered to newly-hired employees at the end of their first three months which greatly assisted in goal setting. Staff luncheons and the in-house volleyball and basketball competitions remained an effective part of staff unity and development and a support program was also introduced to help all staff with any job-related issues which gave employees a heightened sense of being cared for by the establishment. Another area of change that proved successful was the introduction of the Valuable Employee Program (VEP). When a person was employed in the past they were assigned a senior member of staff who assisted them with getting used to their new job.

H.

Due to the limitations of the senior member’s position however, they were often not in a position to explain any details regarding future advancement. Now, when staff are employed, they are clearly told what is expected in the job and where it might lead to the right candidate. Hotel surveys revealed that over 30 per cent of employees were not satisfied with the career opportunities in their current jobs so the articulation of the definite and realistic opportunity for advancement through the VEP led to a major decrease in

employee attrition. Once the ship had been righted and the relative returns on human resource investments had been calculated, setting priorities became a formality. Although at first a daunting task, the enormous cost of employee turnover offered an excellent opportunity for the hotel to improve profitability.

Question 14-18

Complete the summary below of paragraphs A-D of Reading Passage 2.
Choose ONE OR TWO WORDS from the passage for each answer.

Write your answers in blank spaces next to 14-18 on your answer sheet.

Training new employees; downtime as new employees get used to their new job, and unfavourable guest satisfaction levels all led to a large 14 _____ for a large hotel. It was determined that the solution to these problems, was in the reduction of the company's 15 _____. The hotel addressed these issues in 4 ways through the implementation of a 16 _____. The efforts of the hotel chief executive decreased downtime and reduced employee turnover which, in turn, resulted in improvements in 17 _____. The company position was improved by \$10 million. It is not common for big companies to experience such 18 _____

Question 19-21

Do the following statements reflect the claims of the writer in Reading Passage 2?
In boxes 19-21 on your answer sheet write

YES, if the statement reflects the claims of the writer

NO, if the statement contradicts the claims of the writer

NOT GIVEN, if it is impossible to say what the writer thinks about this

19. It was surprising that positions with the highest turnover were not connected to high costs.

20. There was a clear connection between high costs and length of training.

21. New employees were given an incorrect description of their job.

Question 22-26

Reading Passage 2 gives FIVE effective changes that the hotel introduced for staff
Choose these changes from list A-L below.

Write the appropriate letters A-K in boxes 22-26 on your answer sheet.

A changes

B discussed future plans

C introduced regular staff luncheons

D started a regular sports program

E clearly defined job expectations

F did their own staff recruiting

G built new sporting facilities

H involved new staff in goal setting
I offered bonuses to proven, committed new staff
J began meeting regularly with new staff
K implemented a support program
L began recruiting through an employment service

- 22. _____
- 23. _____
- 24. _____
- 25. _____
- 26. _____

SECTION 3

You should spend about 20 minutes on Questions 27-40 which are based on Reading Passage 3

Grimm's Fairy Tales

A.

The Brothers Grimm, Jacob and Wilhelm, named their story collection Children's and Household Tales and published the first of its seven editions in Germany in 1812. The table of contents reads like an A-list of fairy-tale celebrities: Cinderella, Sleeping Beauty, Snow White, Little Red Riding Hood, Rapunzel, Rumpelstiltskin, Hansel and Gretel, the Frog King. Drawn mostly from oral narratives, the 210 stories in die Grimm's' collection represent an anthology of fairy tales, animal fables, rustic farces, and religious allegories that remain unrivalled to this day.

B.

Such lasting fame would have shocked the humble Grimms. During their lifetimes the collection sold modestly in Germany, at first only a few hundred copies a year. The early editions were not even aimed at children. The brothers initially refused to consider illustrations, and scholarly footnotes took up almost as much space as the tales themselves. Jacob and Wilhelm viewed themselves as patriotic folklorists, not as entertainers of children. They began their work at a time when Germany had been overrun by the French under Napoleon, who was intent on suppressing local culture. As young, workaholic scholars, single and sharing a cramped flat, the Brothers Grimm undertook the fairy-tale collection with the goal of serving the endangered oral tradition of Germany.

C.

For much of the 19th-century teachers, parents, and religious figures, particularly in the United States, deplored the Grimms' collection for its raw, uncivilized content. Offended adults objected to the gruesome punishments inflicted on the stories' villains. In the original "Snow White" the evil stepmother is forced to dance in red-hot iron shoes until she falls down dead. Even today some protective parents shy from the Grimms' tales because of their reputation for violence.

D.

Despite its sometimes rocky reception, Children's and Household Tales gradually took root with the public. The brothers had not foreseen that the appearance of their work would coincide with a great flowering of children's literature in Europe. English publishers led the way, issuing high-quality picture books such as Jack and the Beanstalk and handsome folktale collections, all to satisfy a newly literate audience seeking virtuous material for the nursery. Once the Brothers Grimm sighted this new public, they set about

refining and softening their tales, which had originated centuries earlier as earthy peasant fare. In the Grimms' hands, cruel mothers became nasty stepmothers, unmarried lovers were made chaste, and the incestuous father was recast as the devil.

E.

In the 20th century, the Grimms' fairy tales have come to rule the bookshelves of children's bedrooms. The stories read like dreams come true: handsome lads and beautiful damsels, armed with magic, triumph over giants and witches and wild beasts. They outwit mean, selfish adults. Inevitably the boy and girl fall in love and live happily ever after. And parents keep reading because they approve of the finger-wagging lessons inserted into the stories: keep your promises, don't talk to strangers, work hard, obey your parents. According to the Grimms, the collection served as "a manual of manners".

F.

Altogether some 40 persons delivered tales to the Grimms. Many of the storytellers came to the Grimms' house in Kassel. The brothers particularly welcomed the visits of Dorothea Viehmann, a widow who walked to town to sell produce from her garden. An innkeeper daughter, Viehmann had grown up listening to stories from travellers on the road to Frankfurt. Among her treasure was "Aschenputtel" -Cinderella. Marie Hassenpflug was a 20-year-old friend of their sister, Charlotte, from a well-bred, French-speaking family. Marie's wonderful stories blended motifs from the oral tradition and from Perrault's influential 1697 book, *Tales of My Mother Goose*, which contained elaborate versions of "Little Red Riding Hood", "Snow White", and "Sleeping Beauty", among others. Many of these had been adapted from earlier Italian tales.

G.

Given that the origins of many of the Grimm fairy tales reach throughout Europe and into the Middle East and Orient, the question must be asked: How German are the Grimm tales? Very, says scholar Heinz Rolleke. Love of the underdog, rustic simplicity, creative energy—these are Teutonic traits. The coarse texture of life during medieval times in Germany, when many of the tales entered the oral tradition, also coloured the narratives. Throughout Europe, children were often neglected and abandoned, like Hansel and Gretel. Accused witches were burned at the stake, like the evil mother-in-law in "The Six Swans". "The cruelty in the stories was not the Grimm's fantasy", Rolleke points out "It reflected the law-and-order system of the old times".

H.

The editorial fingerprints left by the Grimms betray the specific values of 19th-century Christian, bourgeois German society. But that has not stopped the tales from being embraced by almost every culture and nationality in the world. What accounts for this widespread, enduring popularity? Bernhard Lauer points to the "universal style" of the writing, you have no concrete descriptions of the land, or the clothes, or the forest, or the castles. It makes the stories timeless and placeless," The tales allow us to express 'our

utopian longings’,” says Jack Zipes of the University of Minnesota, whose 1987 translation of the complete fairy tales captures the rustic vigour of the original text. They show a striving for happiness that none of us knows but that we sense is possible. We can identify with the heroes of the tales and become in our mind the masters and mistresses of our own destinies.”

I.

Fairy tales provide a workout for the unconscious, psychoanalysts maintain. Bruno Bettelheim famously promoted the therapeutic of the Grimms’ stories, calling fairy tales the “great comforters. By confronting fears and phobias, symbolized by witches, heartless stepmothers, and hungry wolves, children find they can master their anxieties. Bettelheim’s theory continues to be hotly debated. But most young readers aren’t interested in exercising their unconsciousness. The Grimm tales, in fact, please in an infinite number of ways, something about them seems to mirror whatever moods or interests we bring to our reading of them. The flexibility of interpretation suits them for almost any time and any culture.

Questions 27-32

Do the following statements agree with the information given in Reading Passage 1?
In boxes 27-32 on your answer sheet, write

YES if the statement is true
NO if the statement is false
NOT GIVEN if the information is not given in the passage

27. The Grimm brothers believed they would achieve international fame.
28. The Grimm brothers were forced to work in secret.
29. Some parents today still think Grimm fairy tales are not suitable for children.
30. The first edition of Grimm’s fairy tales sold more widely in England than in Germany.
31. Adults like reading Grimm’s fairy tales for reasons different from those of children.
32. The Grimm brothers based the story “Cinderella” on the life of Dorothea Viehmann

Questions 33-35

Choose the correct letter, A, B, C or D.
Write your answers in boxes 33-35 on your answer sheet.

33. In paragraph 4, what changes happened at that time in Europe?
 - A. Literacy levels of the population increased.
 - B. The development of printing technology made it easier to publish.
 - C. Schools were open to children.
 - D. People were fond of collecting superb picture books.
34. What changes did the Grimm Brothers make in later editions?
 - A. They made the stories shorter.

- B. They used more oral language.
- C. The content of the tales became less violent.
- D. They found other origins of the tales.

35. What did Marie Hassenpflug contribute to the Grimm's Fairy tales?

- A. She wrote stories.
- B. She discussed the stories with them.
- C. She translated a popular book for the brothers using her talent for languages.
- D. She told the oral stories that were based on traditional Italian stories.

Questions 36-40

Complete the following summary of the paragraphs of Reading Passage

Using NO MORE THAN TWO WORDS from the Reading Passage for each answer.
Write your answers in boxes 36-40 on your answer sheet.

- 36. Heinz Rolleke said the Grimm's tales are "German" because the tales
- 37. Heinz Rolleke said the abandoned children in tales
- 38. Bernhard Lauer said the writing style of the Grimm brothers is universal because they
- 39. Jack Zipes said the pursuit of happiness in the tales means they
- 40. Bruno Bettelheim said the therapeutic value of the tales means that the fairy tales

- A reflect what life was like at that time
- B help children deal with their problems
- C demonstrate the outdated system
- D tell of the simplicity of life in the German countryside
- E encourage people to believe that they can do anything
- F recognize the heroes in the real life
- G contribute to the belief in nature power
- H avoid details about characters' social settings.

Reading Test 10

SECTION 1

You should spend about 20 minutes on Questions 1-13 which are based on Reading Passage 1

Early Childhood Education

New Zealand's National Party spokesman on education, Dr Lockwood Smith, recently visited the US and Britain. Here he reports on the findings of his trip and what they could mean for New Zealand's education policy

A.

'Education To Be More' was published last August. It was the report of the New Zealand Government's Early Childhood Care and Education Working Group. The report argued for enhanced equity of access and better funding for childcare and early childhood education institutions. Unquestionably, that's a real need; but since parents don't normally send children to pre-schools until the age of three, are we missing out on the most important years of all?

B.

A 13 year study of early childhood development at Harvard University has shown that, by the age of three, most children have the potential to understand about 1000 words - most of the language they will use in ordinary conversation for the rest of their lives.

Furthermore, research has shown that while every child is born with a natural curiosity, it can be suppressed dramatically during the second and third years of life. Researchers claim that the human personality is formed during the first two years of life, and during the first three years children learn the basic skills they will use in all their later learning both at home and at school. Once over the age of three, children continue to expand on existing knowledge of the world.

C.

It is generally acknowledged that young people from poorer socio-economic backgrounds tend to do less well in our education system. That's observed not just in New Zealand, but also in Australia, Britain and America. In an attempt to overcome that educational under-achievement, a nationwide programme called 'Headstart' was launched in the United States in 1965. A lot of money was poured into it. It took children into pre-school institutions at the age of three and was supposed to help the children of poorer families succeed in school.

Despite substantial funding, results have been disappointing. It is thought that there are two explanations for this. First, the programme began too late. Many children who entered

it at the age of three were already behind their peers in language and measurable intelligence. Second, the parents were not involved. At the end of each day, 'Headstart' children returned to the same disadvantaged home environment.

D.

As a result of the growing research evidence of the importance of the first three years of a child's life and the disappointing results from 'Headstart', a pilot programme was launched in Missouri in the US that focused on parents as the child's first teachers. The 'Missouri' programme was predicated on research showing that working with the family, rather than bypassing the parents, is the most effective way of helping children get off to the best possible start in life. The four-year pilot study included 380 families who were about to have their first child and who represented a cross-section of socio-economic status, age and family configurations. They included single-parent and two-parent families, families in which both parents worked, and families with either the mother or father at home.

The programme involved trained parent-educators visiting the parents' home and working with one parent, or parents, and the child. Information on child development, and guidance on things to look for and expect as the child grows were provided, plus guidance in fostering the child's intellectual, language, social and motor-skill development. Periodic check-ups of the child's educational and sensory development (hearing and vision) were made to detect possible handicaps that interfere with growth and development. Medical problems were referred to professionals.

Parent-educators made personal visits to homes and monthly group meetings were held with other new parents to share experience and discuss topics of interest. Parent resource centres, located in school buildings, offered learning materials for families and facilitators for child care.

E.

At the age of three, the children who had been involved in the 'Missouri' programme were evaluated alongside a cross-section of children selected from the same range of socio-economic backgrounds and family situations, and also a random sample of children that age. The results were phenomenal. By the age of three, the children in the programme were significantly more advanced in language development than their peers, had made greater strides in problem solving and other intellectual skills, and were further along in social development, in fact, the average child on the programme was performing at the level of the top 15 to 20 per cent of their peers in such things as auditory comprehension, verbal ability and language ability.

Most important of all, the traditional measures of 'risk', such as parents' age and education, or whether they were a single parent, bore little or no relationship to the measures of achievement and language development. Children in the programme performed equally well regardless of socio-economic disadvantages. Child abuse was virtually eliminated. The one factor that was found to affect the child's development was family stress leading to a poor quality of parent-child interaction. That interaction was not necessarily bad in poorer families.

F.

These research findings are exciting. There is growing evidence in New Zealand that children from poorer socio-economic backgrounds are arriving at school less well developed and that our school system tends to perpetuate that disadvantage. The initiative outlined above could break that cycle of disadvantage. The concept of working with parents in their homes, or at their place of work, contrasts quite markedly with the report of the Early Childhood Care and Education Working Group. Their focus is on getting children and mothers access to childcare and institutionalised early childhood education. Education from the age of three to five is undoubtedly vital, but without a similar focus on parent education and on the vital importance of the first three years, some evidence indicates that it will not be enough to overcome educational inequity.

Questions 1-4

Reading Passage has six sections, A-F.

Which paragraph contains the following information?

Write the correct letter A-F in boxes 1-4 on your answer sheet.

1. details of the range of family types involved in an education programme
2. reasons why a child's early years are so important
3. reasons why an education programme failed
4. a description of the positive outcomes of an education programme

Questions 5-10 Classify the following features as characterising

A the 'Headstart' programme

B the 'Missouri' programme

C both the 'Headstart' and the 'Missouri' programmes

D neither the 'Headstart' nor the 'Missouri' programme

Write the correct letter A, B, C or D in boxes 5-10 on your answer sheet.

5. was administered to a variety of poor and wealthy families
6. continued with follow-up assistance in elementary schools
7. did not succeed in its aim
8. supplied many forms of support and training to parents
9. received insufficient funding
10. was designed to improve pre-schoolers' educational development

Questions 11-13

Do the following statements agree with the information given in Reading Passage?

In boxes 11-13 on your answer sheet, write

TRUE if the statement agrees with the information

FALSE if the statement contradicts the information

NOT GIVEN if there is no information on this

11. Most 'Missouri' programme three-year-olds scored highly in areas such as listening, speaking, reasoning and interacting with others.

12. 'Missouri' programme children of young, uneducated, single parents scored less highly on the tests.

13. The richer families in the 'Missouri' programme had higher stress levels.

SECTION 2

You should spend about 20 minutes on Questions 14-27 which are based on Reading Passage 2

The reconstruction of community in *Talbot Park*, Auckland

A

An architecture of disguise is almost complete at Talbot Park in the heart of Auckland's Glen Innes. The place was once described as a state housing ghetto, rife with crime, vandalism and other social problems. But today after a \$48 million urban renewal makeover, the site is home to 700 residents – 200 more than before – and has people regularly inquiring whether they can buy or rent there. “It doesn't look like social housing,” Housing New Zealand housing services manager Dene Busby says of the tidy brick and weatherboard apartments and townhouses which would look just as much at home in “there is no reason why public housing should look cheap in my view,” says Design Group architect Neil of the eight three-bedroom terrace houses his firm designed.

B

Talbot Park is a triangle of government-owned land bounded by Apirana Ave, Pilkington Rd and Point England Rd. in the early 1960s, it was developed for state housing built around a linear park that ran through the middle. Initially, there was a strong sense of a family-friendly community. Former residents recall how the Talbot Park reserve played a big part in their childhoods – a place where the kids in the block came together to play softball, cricket, tiggy, leapfrog and bullrush. Sometimes they'd play “Maoris against Pakehas” but without any animosity. “It was all just good fun”, says Georgie Thompson in Ben Schrader's *We Call it Home: A History of State Housing in New Zealand*. “We had respect for our neighbours and addressed them by title Mr. and Mrs. so-and-so,” she recalls.

C

Quite what went wrong with Talbot Park is not clear. We call it Home Records that the community began to change in the late 1970s as more Pacific Islanders and Europeans moved in. The new arrivals didn't readily integrate with the community, a “them and us” mentality developed, and residents interact with their neighbours less. What was clear was the buildings were deteriorating and becoming dilapidated, petty crime was on the rise and the reserve – the focus of fond childhood memories – had become a wasteland and was considered unsafe.

D

But it wasn't until 2002 that Housing New Zealand decided the properties needed upgrading. The master renewal plan didn't take advantage of the maximum

accommodation density allowable (one unit per 100 sq metres) but did increase density to one unit per 180 sq m by refurbishing all 108 star flat units, removing the multis and building 111 new home. The Talbot strategy can be summed up as mix, match and manage. Mix up the housing with various plans from a mix of architects, match house styles to what's built by the private sector, match tenants to the mix, and manage their occupancy. Inevitably cost comes into the equation. "If you're going to build low-cost homes, you've got to keep them simple and you can't afford a fancy bit on them." Says Michael Thompson of *Architectus* which designed the innovative three-level Atrium apartments lining two sides of a covered courtyard. At \$300,000 per two-bedroom unit, the building is more expensive but provides for independent disabled accommodation as well as offering solar hot water heating and rainwater collection for toilet cisterns and outside taps.

E

The renewal project budget at \$1.5 million which will provide park pathways, planting, playgrounds, drinking fountains, seating, skateboard rails, a half-size basketball hard court, and a pavilion. But if there was any doubt this is a low socio-economic area, the demographics for the surrounding Tamaki area are sobering. Of the 5000 households there, 55 per cent are statehouses, 28 per cent privately owned (compared to about 65 per cent nationally) and 17 per cent are private rental. The area has a high concentration of households with incomes in the \$5000 to \$15,000 range and very few with an income of over \$70,000. That's in sharp contrast to the more affluent suburbs like Kohimarama and St John's that surround the area.

F

"The design is for people with different culture background," says architect James Lunday of Common Ground which designed the 21 large family homes. "Architecturally we decided to be relatively conservative – a nice house in its own garden with a bit of space and good indoor-outdoor flow." There's a slight reflection of the whare and a Pacific fale, but not overplayed "The private sector is way behind in urban design and sustainable futures," says Bracey. "Redesigning streets and parks is a big deal and very difficult to do. The private sector won't do it, because it's so hard.

G

There's no doubt good urban design and good architecture play a significant part in the scheme. But probably more important is a new standard of social control. Housing New Zealand calls it "intensive tenancy management". Others view it as social engineering. "It's a model that we are looking at going forward," according to Housing New Zealand's central Auckland regional manager Graham Bodman. "The focus is on frequent inspections, helping tenants to get to know each other and trying to create an environment of respect for neighbours," says Bodman. That includes some strict rules – no loud parties after 10 pm, no dogs, no cats in the apartments, no washing hung over balcony rails and a requirement to mow lawns and keep the property tidy. Housing New Zealand has also been active in organising morning teas and street barbecues for residents to meet their

neighbours. "It's all based on the intensification," says Community Renewal project manager Stuart Bracey. "We acknowledge if you are going to put more people living closer together, you have to actually help them to live closer together because it creates tension – especially for people that aren't used to it."

Questions 14-20

The Reading Passage has seven paragraphs A-G

Choose the correct heading for paragraphs, A-G, from the list below.

Write the correct number, i-x, in boxes 14-20 on your answer sheet.

List of Headings

- i Financial hardship of community
 - ii A good tendency of strengthening the supervision
 - iii Details of plans for the community's makeover and upgrade
 - iv Architecture suits families of various ethnic origins
 - v Problems arise then the mentality of alienation developed later
 - vi Introduction of a social housing community with unexpected high standard
 - vii A practical design and need assist and cooperate in future
 - viii closer relationship among neighbors in the original site
 - ix different need from a makeup of a low financial background should be considered
 - x How to make the community feel safe
 - xi a plan with details for the house structure
- 14. Paragraph A
 - 15. Paragraph B
 - 16. Paragraph C
 - 17. Paragraph D
 - 18. Paragraph E
 - 19. Paragraph F
 - 20. Paragraph G

Questions 21-23

Use the information in the passage to match the people (listed A-E) with opinions or deeds below.

Write the appropriate letters, A-E, in boxes 21-23 on your answer sheet.

List of people

- A Michael Thompson
 - B Graham Bodman
 - C Stuart Bracey
 - D James Lunday
 - E Dene Busby
- 21. Design should meet the need of mix-raced cultural background
 - 22. for a better living environment, regulations and social control should be imperative
 - 23. organising more community's activities helps to strengthen the relationship in the community

Questions 24-27

Complete the following summary of the paragraphs of Reading Passage 2

Choose NO MORE THAN TWO WORDS from the passage for each answer.

Write your answers in boxes 24-27 on your answer sheet.

In the year 2002, the Talbot decided to raise housing standard, yet the plan was to build homes go much beyond the accommodation limit and people complain about the high living 24.....

And as the various plans were complemented under the designs of many 25..... together, made house styles go with the part designed by individuals, matched tenants from a different culture. As for the finance, reconstruction program's major concern is to build a house within low 26.....; finally, just as expert predicted, residents will agree on building a relatively conventional house in its own 27, which provides considerable space to move around.

SECTION 3

You should spend about 20 minutes on Questions 28-40 which are based on Reading Passage 3

Elephant communication

A

A postdoctoral fellow at Stanford University, O’Connell-Rodwell has come to Namibia’s premiere wildlife sanctuary to explore the mysterious and complex world of elephant communication. She and her colleagues are part of a scientific revolution that began nearly two decades ago with the stunning revelation that elephants communicate over long distances using low-frequency sounds, also called infrasounds, that are too deep to be heard by most humans.

B

As might be expected, the African elephant’s ability to sense seismic sound may begin in the ears. The hammer bone of the elephant’s inner ear is proportionally very large for a mammal, but typical for animals that use vibrational signals. It may, therefore, be a sign that elephants can communicate with seismic sounds. Also, the elephant and its relative the manatee are unique among mammals in having reverted to a reptilian-like cochlear structure in the inner ear. The cochlea of reptiles facilitates a keen sensitivity to vibrations and may do the same in elephants.

C

But other aspects of elephant anatomy also support that ability. First, their enormous bodies, which allow them to generate low-frequency sounds almost as powerful as those of a jet takeoff, provide ideal frames for receiving ground vibrations and conducting them to the inner ear. Second, the elephant’s toe bones rest on a fatty pad that might help focus vibrations from the ground into the bone. Finally, the elephant’s enormous brain lies in the cranial cavity behind the eyes in line with the auditory canal. The front of the skull is riddled with sinus cavities that may function as resonating chambers for vibrations from the ground.

D

How the elephants sense these vibrations is still unknown, but O’Connell-Rodwell who just earned a graduate degree in entomology at the University of Hawaii at Manoa, suspects the pachyderms are “listening” with their trunks and feet. The trunk may be the most versatile appendage in nature. Its uses include drinking, bathing, smelling, feeding and scratching. Both trunk and feet contain two kinds of pressure-sensitive nerve endings – one that detects infrasonic vibrations and another that responds to vibrations with slightly higher frequencies. For O’Connell-Rodwell, the future of the research is boundless

and unpredictable: “Our work is really at the interface of geophysics, neurophysiology and ecology,” she says. “We’re asking questions that no one has really dealt with before.”

E

Scientists have long known that seismic communication is common in small animals, including spiders, scorpions, insects and a number of vertebrate species such as white-lipped frogs, blind mole rats, kangaroo rats and golden moles. They also have found evidence of seismic sensitivity in elephant seals – 2-ton marine mammals that are not related to elephants. But O’Connell-Rodwell was the first to suggest that a large land animal also in sending and receiving seismic messages. O’Connell-Rodwell noticed something about the freezing behavior of Etosha’s six-ton bulls that reminded her of the tiny insects back in her lab. “I did my masters thesis on seismic communication in planthoppers,” she says. “I’d put a male planthopper on a stem and playback a female call, and the male would do the same thing the elephants were doing: He would freeze, then press down on his legs, go forward a little bit, then freeze again. It was just so fascinating to me, and it’s what got me to think, maybe there’s something else going on other than acoustic communication.”

F

Scientists have determined that an elephant’s ability to communicate over long distances is essential for its survival, particularly in a place like Etosha, where more than 2,400 savanna elephants range over an area larger than New Jersey. The difficulty of finding a mate in this vast wilderness is compounded by elephant reproductive biology. Females breed only when in estrus – a period of sexual arousal that occurs every two years and lasts just a few days. “Females in estrus make these very low, long calls that bulls home in on, because it’s such a rare event,” O’Connell-Rodwell says. These powerful estrus calls carry more than two miles in the air and maybe accompanied by long-distance seismic signals, she adds. Breeding herds also use low-frequency vocalizations to warn of predators. Adult bulls and cows have no enemies, except for humans, but young elephants are susceptible to attacks by lions and hyenas. When a predator appears, older members of the herd emit intense warning calls that prompt the rest of the herd to clump together for protection, then flee. In 1994, O’Connell-Rodwell recorded the dramatic cries of a breeding herd threatened by lions at Mushara. “The elephants got really scared, and the matriarch made these very powerful warning calls, and then the herd took off screaming and trumpeting,” she recalls. “Since then, every time we’ve played that particular call at the water hole, we get the same response – the elephants take off.”

G

Reacting to a warning call played in the air is one thing, but could the elephants detect calls transmitted only through the ground? To find out, the research team in 2002 devised an experiment using electronic equipment that allowed them to send signals through the ground at Mushara. The results of our 2002 study showed us that elephants do indeed detect warning calls played through the ground,” O’Connell-Rodwell observes. “We expected them to clump up into tight groups and leave the area, and that’s in fact what

they did. But since we only played back one type of call, we couldn't really say whether they were interpreting it correctly. Maybe they thought it was a vehicle or something strange instead of a predator warning."

H

An experiment last year was designed to solve that problem by using three different recordings – the 1994 warning call from Mushara, an anti-predator call recorded by scientist Joyce Poole in Kenya and an artificial warble tone. Although still analyzing data from this experiment, O'Connell-Rodwell is able to make a few preliminary observations: "The data I've seen so far suggest that the elephants were responding as I had expected. When the '94 warning call was played back, they tended to clump together and leave the water hole sooner. But what's really interesting is that the unfamiliar anti-predator call from Kenya also caused them to clump up, get nervous and aggressively rumble – but they didn't necessarily leave. I didn't think it was going to be that clear cut."

Questions 28-31

Complete the following summary of the paragraphs of Reading Passage
Using **NO MORE THAN THREE WORDS** from the Reading Passage for each answer.
Write your answers in boxes 28-31 on your answer sheet.

Questions 32-38

Complete the following summary of the paragraphs of Reading Passage.
Using **NO MORE THREE WORDS OR A NUMBER** from the Reading Passage for each answer.
Write your answers in boxes 32-38 on your answer sheet.

How the elephants sense these sound vibrations is still unknown, but O'Connell-Rodwell, a fresh graduate in entomology at the University of Hawaii, proposes that the elephants are "listening" with their 32....., by two kinds of nerve endings – that responds to vibrations with both 33..... frequency and slightly higher

frequencies. O'Connell-Rodwell work is at the combination of geophysics, neurophysiology and **34**.....," and it also was the first to indicate that a large land animal also is sending and receiving **35** , O'Connell-Rodwell noticed the freezing behavior by putting a male planthopper communicative approach other than **36**"

Scientists have determined that an elephant's ability to communicate over long distances is essential, especially, when elephant herds are finding a **37**..... , or are warning of predators. Finally, the results of our 2002 study showed us that elephants can detect warning calls played through the **38**..... "

Questions 39-40

Choose the correct letter, **A, B, C** or **D**.

Write your answers in boxes **39-40** on your answer sheet.

39. According to the passage, it is determined that an elephant need to communicate over long distances for its survival

- A.** When a threatening predator appears.
- B.** When young elephants meet humans.
- C.** When older members of the herd want to flee from the group.
- D.** When a male elephant is in estrus.

40. What is the author's attitude toward the experiment by using three different recordings in the paragraph:

- A.** the outcome is definitely out of the original expectation
- B.** the data can not be very clearly obtained
- C.** the result can be somewhat undecided or inaccurate
- D.** the result can be unfamiliar to the public

Reading Test 11

SECTION 1

You should spend about 20 minutes on Questions 1-13 which are based on Section 1 below.

History of Refrigeration

A.

Refrigeration is a process of removing heat, which means cooling an area or a substance below the environmental temperature. Mechanical refrigeration makes use of the evaporation of a liquid refrigerant, which goes through a cycle so that it can be reused. The main cycles include vapour-compression, absorption steam-jet or steam-ejector, and airing. The term 'refrigerator' was first introduced by a Maryland farmer Thomas Moore in 1803, but it is in the 20th century that the appliance we know today first appeared.

B.

People used to find various ways to preserve their food before the advent of mechanical refrigeration systems. Some preferred using cooling systems of ice or snow, which meant that diets would have consisted of very little fresh food or fruits and vegetables, but mostly of bread, cheese and salted meals. For milk and cheeses, it was very difficult to keep them fresh, so such foods were usually stored in a cellar or window box. In spite of those measures, they could not survive rapid spoilage. Later on, people discovered that adding such chemical as sodium nitrate or potassium nitrate to water could lead to a lower temperature. In 1550 when this technique was first recorded, people used it to cool wine, as was the term 'to refrigerate'. Cooling drinks grew very popular in Europe by 1600, particularly in Spain, France, and Italy. Instead of cooling water at night, people used a new technique: rotating long-necked bottles of water which held dissolved saltpeter. The solution was intended to create very low temperatures and even to make ice. By the end of the 17th century, iced drink including frozen juices and liquors had become extremely fashionable in France.

C.

People's demand for ice soon became strong. Consumers' soaring requirement for fresh food, especially for green vegetables, resulted in reform in people's dieting habits between 1830 and the American Civil War, accelerated by a drastic expansion of the urban areas and the rapid amelioration in an economy of the populace. With the growth

of the cities and towns, the distance between the consumer and the source of food was enlarged. In the 1790s as a commercial product, ice was first transported out of Canal Street in New York City to Charleston, South Carolina. Unfortunately, this transportation was not successful because when the ship reached the destination, little ice left. Frederick Tudor and Nathaniel Wyeth, two New England' businessmen, grasped the great potential opportunities for ice business and managed to improve the storage method of ice in the process of shipment. The acknowledged 'Ice King' in that time, Tudor concentrated his efforts on bringing the ice to the tropical areas. In order to achieve his goal and guarantee the ice to arrive at the destination safely he tried many insulating materials in an experiment and successfully constructed the ice containers, which reduced the ice loss from 66 per cent to less than 8 per cent drastically. Wyeth invented an economical and speedy method to cut the ice into uniform blocks, which had a tremendous positive influence on the ice industry. Also, he improved the processing techniques for storing, transporting and distributing ice with less waste.

D.

When people realised that the ice transported from the distance was not as clean as previously thought and gradually caused many health problems, it was more demanding to seek the clean natural sources of ice. To make it worse, by the 1890s water pollution and sewage dumping made clean ice even more unavailable. The adverse effect first appeared in the blowing industry, and then seriously spread to such sectors as meat packing and dairy industries. As a result, the clean, mechanical refrigeration was considerably in need.

E.

Many inventors with creative ideas took part in the process of inventing refrigeration, and each version was built on the previous discoveries. Dr William Cullen initiated to study the evaporation of liquid under the vacuum conditions in 1720. He soon invented the first man-made refrigerator at the University of Glasgow in 1748 with the employment of ethyl ether boiling into a partial vacuum. American inventor Oliver Evans designed the refrigerator firstly using vapour rather than liquid in 1805. Although his conception was not put into practice in the end the mechanism was adopted by an American physician John Gorrie, who made one cooling machine similar to Evans' in 1842 with the purpose of reducing the temperature of the patient with yellow fever in a Florida hospital. Until 1851, Evans obtained the first patent for mechanical refrigeration in the USA. In 1820, Michael Faraday, a Londoner, first liquefied ammonia to cause cooling. In 1859, Ferdinand Carre from France invented the first version of the ammonia water cooling machine. In 1873, Carl von Linde designed the first practical and portable compressor refrigerator in Munich, and in 1876 he abandoned the methyl ether system and began

using an ammonia cycle. Linde later created a new method ('Linde technique') for liquefying large amounts of air in 1894. Nearly a decade later, this mechanical refrigerating method was adopted subsequently by the meat packing industry in Chicago.

F.

Since 1840, cars with the refrigerating system had been utilised to deliver and distribute milk and butter. Until 1860, most seafood and dairy products were transported with cold-chain logistics. In 1867, refrigerated, railroad cars are patented to J.B, Sutherland from Detroit, Michigan, who invented insulated cars by installing the ice bunkers at the end of the cars: air came in from the top, passed through the bunkers, circulated through the cars by gravity and controlled by different quantities of hanging flaps which caused different air temperatures. Depending on the cargo (such as meat, fruits etc.) transported by the cars, different car designs came into existence. In 1867, the first refrigerated car to carry fresh fruit was manufactured by Parker Earle of Illinois, who shipped strawberries on the Illinois Central Railroad. Each chest was freighted with 100 pounds of ice and 200 quarts of strawberries. Until 1949, the trucking industry began to be equipped with the refrigeration system with a roof-mounted cooling device, invented by Fred Jones.

G.

From the late 1800s to 1929, the refrigerators employed toxic gases – methyl chloride, ammonia, and sulfur dioxide – as refrigerants. But in the 1920s, a great number of lethal accidents took place due to the leakage of methyl chloride out of refrigerators. Therefore, some American companies started to seek some secure methods of refrigeration. Frigidaire detected a new class of synthetic refrigerants called halocarbons or CFCs (chlorofluorocarbons) in 1928. This research led to the discovery of chlorofluorocarbons (Freon), which quickly became the prevailing material in compressor refrigerators. Freon was safer for the people in the vicinity, but in 1973 it was discovered to have detrimental effects on the ozone layer. After that, new improvements were made, and Hydrofluorocarbons, with no known harmful effects, was used in the cooling system. Simultaneously, nowadays, Chlorofluorocarbons (CFS) are no longer used; they are announced illegal in several places, making the refrigeration far safer than before.

Questions 1-5

Look at the following events (Questions 1-5) and the list of dates below.

Match each event with the correct date, A-F.

Write the correct letter, A-F, in boxes 1-5 on your answer sheet.

List of Dates

- A.1550
- B.1799
- C.1803
- D.1840
- E.1949
- F.1973

1. Vehicles with refrigerators were used to transport on the road.
2. Ice was sold around the United States for the first time.
3. Some kind of chemical refrigerant was found harmful to the atmosphere.
4. The term 'refrigerator' was firstly introduced.
5. Some chemicals were added to refrigerate wine.

Questions 6-10

Look at the following opinions or deeds (Questions 6-10) and the list of people below. Match each opinion or deed with the correct person, A-G.

Write the correct letter, A-G, in boxes 6-10 on your answer sheet.

List of People

- A. Thomas Moore
- B. Frederick Tudor
- C. Carl Von Linde
- D. Nathaniel Wyeth
- E. J.B. Sutherland
- F. Fred Jones
- G. Parker Earle

6. patented the idea that refrigerating system can be installed on tramcars
7. invented an ice-cutting technical method that could save money and time
8. enabled the cold storage technology to be applied in fruit
9. invented a cooling device applied into the trucking industry
10. created a new technique to liquefy the air

Questions 11-13

Complete each sentence with the correct ending, A-E, below.

Write the correct letter, A-E, in boxes 11-14 on your answer sheet.

11. A healthy dietary change between 1830 and the American Civil War was greatly associated with.....

12. The development of urbanisation was likely to cause.....

13. Problems due to water treatment contributed to.....

A. new developments, such as the application of Hydrofluorocarbons.

B. consumers' demand for fresh food, especially for vegetables.

C. the discovery of chlorofluorocarbons (Freon).

D. regional transportation system for refrigeration for a long distance.

E. extensive spread of the refrigeration method.

SECTION 2

Smell and Memory

Smells like yesterday

Why does the scent of a fragrance or the mustiness of an old trunk trigger such powerful memories of childhood? New research has the answer, writes Alexandra Witze.

A.

You probably pay more attention to a newspaper with your eyes than with your nose. But lift the paper to your nostrils and inhale. The smell of newsprint might carry you back to your childhood, when your parents perused the paper on Sunday mornings. Or maybe some other smell takes you back -the scent of your mother's perfume, the pungency of a driftwood campfire. Specific odors can spark a flood of reminiscences. Psychologists call it the "Proustian phenomenon", after French novelist Marcel Proust. Near the beginning of the masterpiece *In Search of Lost Time*, Proust's narrator dunks a madeleine cookie into a cup of tea -and the scent and taste unleash a torrent of childhood memories for 3000 pages.

B.

Now, this phenomenon is getting the scientific treatment. Neuroscientists Rachel Herz, a cognitive neuroscientist at Brown University in Providence, Rhode Island, have discovered, for instance, how sensory memories are shared across the brain, with different brain regions remembering the sights, smells, tastes and sounds of a particular experience. Meanwhile, psychologists have demonstrated that memories triggered by smells can be more emotional, as well as more detailed, than memories not related to smells. When you inhale, odor molecules set brain cells dancing within a region known as the amygdala, a part of the brain that helps control emotion. In contrast, the other senses, such as taste or touch, get routed through other parts of the brain before reaching the amygdala. The direct link between odors and the amygdala may help explain the emotional potency of smells. "There is this unique connection between the sense of smell and the part of the brain that processes emotion," says Rachel Herz.

C.

But the links don't stop there. Like an octopus reaching its tentacles outward, the memory of smells affects other brain regions as well. In recent experiments, neuroscientists at University College London (UCL) asked 15 volunteers to look at pictures while smelling

unrelated odors. For instance, the subjects might see a photo of a duck paired with the scent of a rose, and then be asked to create a story linking the two. Brain scans taken at the time revealed that the volunteers' brains were particularly active in a region known as the olfactory cortex, which is known to be involved in processing smells. Five minutes later, the volunteers were shown the duck photo again, but without the rose smell. And in their brains, the olfactory cortex lit up again, the scientists reported recently. The fact that the olfactory cortex became active in the absence of the odor suggests that people's sensory memory of events is spread across different brain regions. Imagine going on a seaside holiday, says UCL team leader, Jay Gottfried. The sight of the waves becomes stored in one area, whereas the crash of the surf goes elsewhere, and the smell of seaweed in yet another place. There could be advantages to having memories spread around the brain. "You can reawaken that memory from any one of the sensory triggers," says Gottfried. "Maybe the smell of the sun lotion, or a particular sound from that day, or the sight of a rock formation." Or in the case of an early hunter and gatherer (out on a plain – the sight of a lion might be enough to trigger the urge to flee, rather than having to wait for the sound of its roar and the stench of its hide to kick in as well.

D.

Remembered smells may also carry extra emotional baggage, says Herz. Her research suggests that memories triggered by odors are more emotional than memories triggered by other cues. In one recent study, Herz recruited five volunteers who had vivid memories associated with a particular perfume, such as opium for Women and Juniper Breeze from Bath and Body Works. She took images of the volunteers' brains as they sniffed that perfume and an unrelated perfume without knowing which was which. (They were also shown photos of each perfume bottle.) Smelling the specified perfume activated the volunteers brains the most, particularly in the amygdala, and in a region called the hippocampus, which helps in memory formation. Herz published the work earlier this year in the journal *Neuropsychologia*.

E.

But she couldn't be sure that the other senses wouldn't also elicit a strong response. So, in another study Herz compared smells with sounds and pictures. She had 70 people describe an emotional memory involving three items-popcorn, fresh-cut grass and a campfire. Then they compared the items through sights, sounds and smells. For instance, the person might see a picture of a lawnmower, then sniff the scent of grass and finally listen to the lawnmower's sound. Memories triggered by smell were more evocative than memories triggered by either sights or sounds.

F.

Odor-evoked memories may be not only more emotional, but more detailed as well. Working with colleague John Downes, psychologist Simon Chu of the University of Liverpool started researching odor and memory partly because of his grandmother's stories about Chinese culture. As generations gathered to share oral histories, they would pass a small pot of spice or incense around; later, when they wanted to remember the story in as much detail as possible, they would pass the same smell around again. "It's kind of fits with a lot of anecdotal evidence on how smells can be really good reminders of past experiences," Chu says. And scientific research seems to bear out the anecdotes. In one experiment, Chu and Downes asked 42 volunteers to tell a life story, then tested to see whether odors such as coffee and cinnamon could help them remember more detail in the story. They could.

G.

Despite such studies, not everyone is convinced that Proust can be scientifically analyzed. In the June issue of *Chemical Senses*, Chu and Downes exchanged critiques with renowned perfumer and chemist J. Stephan Jellinek. Jellinek chided the Liverpool researchers for, among other things, presenting the smells and asking the volunteers to think of memories, rather than seeing what memories were spontaneously evoked by the odors. But there's only so much science can do to test a phenomenon that's inherently different for each person, Chu says. Meanwhile, Jellinek has also been collecting anecdotal accounts of Proustian experiences, hoping to find some common links between the experiences. "I think there is a case to be made that surprise may be a major aspect of the Proust phenomenon," he says. "That's why people are so struck by these memories." No one knows whether Proust ever experienced such a transcendental moment. But his notions of memory, written as fiction nearly a century ago, continue to inspire scientists of today.

Questions 14-18

Use the information in the passage to match the people (listed A-C) with opinions or deeds below. Write the appropriate letters A-C in boxes 14-18 on your answer sheet.

NB you may use any letter more than once

- A. Rachel Herz
- B. Simon Chu
- C. Jay Gottfried

14. Found pattern of different sensory memories stored in various zones of a brain.

15. Smell brings detailed event under a smell of certain substance.
16. Connection of smell and certain zones of brain is different with that of other senses.
17. Diverse locations of stored information help us keep away the hazard.
18. There is no necessary correlation between smell and processing zone of brain.

Questions 19-22

Choose the correct letter, A, B, C or D.

Write your answers in boxes 19-22 on your answer sheet.

19. What does the experiments conducted by Herz show?

- A. Women are more easily addicted to opium medicine
- B. Smell is superior to other senses in connection to the brain
- C. Smell is more important than other senses
- D. certain part of the brain relates the emotion to the sense of smell

20. What does the second experiment conducted by Herz suggest?

- A. Result directly conflicts with the first one
- B. Result of her first experiment is correct
- C. Sights and sounds trigger memories at an equal level
- D. Lawnmower is a perfect example in the experiment

21. What is the outcome of experiment conducted by Chu and Downes?

- A. smell is the only functional under Chinese tradition
- B. half of volunteers told detailed stories
- C. smells of certain odors assist story tellers
- D. odors of cinnamon is stronger than that of coffee

22. What is the comment of Jellinek to Chu and Downers in the issue of Chemical Senses:

- A. Jellinek accused their experiment of being unscientific
- B. Jellinek thought Liverpool is not a suitable place for experiment
- C. Jellinek suggested that there was no further clue of what specific memories aroused
- D. Jellinek stated that experiment could be remedied

Questions 23-26

Summary

Complete the following summary of the paragraphs of Reading Passage, using **NO MORE THAN THREE WORDS** from the Reading Passage for each answer. Write your answers in boxes 23-26 on your answer sheet.

In the experiments conducted by UCL, participants were asked to look at a picture with a scent of a flower, then in the next stage, everyone would have to 23_____for a connection. A method called 24_____suggested that specific areas of the brain named 25_____were quite active. Then in another paralleled experiment about Chinese elders, storytellers could recall detailed anecdotes when smelling a bowl of 26_____or incense around.

SECTION 3

Learning lessons from the past

A.

Many past societies collapsed or vanished, leaving behind monumental ruins such as those that the poet Shelley imagined in his sonnet, Ozymandias. By collapse, I mean a drastic decrease in human population size and/or political/economic/social complexity, over a considerable area, for an extended time. By those standards, most people would consider the following past societies to have been famous victims of full-fledged collapses rather than of just minor declines: the Anasazi and Cahokia within the boundaries of the modern US, the Maya cities in Central America, Moche and Tiwanaku societies in South America, Norse Greenland, Mycenaean Greece and Minoan Crete in Europe, Great Zimbabwe in Africa, Angkor Wat and the Harappan Indus Valley cities in Asia, and Easter Island in the Pacific Ocean.

B.

The monumental ruins left behind by those past societies hold a fascination for all of us. We marvel at them when as children we first learn of them through pictures. When we grow up, many of us plan vacations in order to experience them at first hand. We feel drawn to their often spectacular and haunting beauty, and also to the mysteries that they pose. The scales of the ruins testify to the former wealth and power of their builders. Yet these builders vanished, abandoning the great structures that they had created at such effort. How could a society that was once so mighty end up collapsing?

C.

It has long been suspected that many of those mysterious abandonments were at least partly triggered by ecological problems: people inadvertently destroying the environmental resources on which their societies depended. This suspicion of unintended ecological suicide (ecocide) has been confirmed by discoveries made in recent decades by archaeologists, climatologists, historians, paleontologists, and palynologists (pollen scientists). The processes through which past societies have undermined themselves by damaging their environments fall into eight categories, whose relative importance differs from case to case: deforestation and habitat destruction, soil problems, water management problems, overhunting, overfishing, effects of introduced species on native species, human population growth, and increased impact of people.

D.

Those past collapses tended to follow somewhat similar courses constituting variations on a theme. Writers find it tempting to draw analogies between the course of human societies and the course of individual human lives - to talk of a society's birth, growth, peak, old age and eventual death. But that metaphor proves erroneous for many past societies: they declined rapidly after reaching peak numbers and power, and those rapid declines must have come as a surprise and shock to their citizens. Obviously, too, this trajectory is not one that all past societies followed unvaryingly to completion: different societies collapsed to different degrees and in somewhat different ways, while many societies did not collapse at all.

E.

Today many people feel that environmental problems overshadow all the other threats to global civilisation. These environmental problems include the same eight that undermined past societies, plus four new ones: human-caused climate change, buildup of toxic chemicals in the environment, energy shortages, and full human utilisation of the Earth's photosynthetic capacity. But the seriousness of these current environmental problems is vigorously debated. Are the risks greatly exaggerated, or conversely are they underestimated? Will modern technology solve our problems, or is it creating new problems faster than it solves old ones? When we deplete one resource (e.g. wood, oil, or ocean fish), can we count on being able to substitute some new resource (e.g. plastics, wind and solar energy, or farmed fish)? Isn't the rate of human population growth declining, such that we're already on course for the world's population to level off at some manageable number of people?

F.

Questions like this illustrate why those famous collapses of past civilisations have taken on more meaning than just that of a romantic mystery. Perhaps there are some practical lessons that we could learn from all those past collapses. But there are also differences between the modern world and its problems, and those past societies and their problems. We shouldn't be so naive as to think that study of the past will yield simple solutions, directly transferable to our societies today. We differ from past societies in some respects that put us at lower risk than them; some of those respects often mentioned include our powerful technology (i.e. its beneficial effects), globalisation, modern medicine, and greater knowledge of past societies and of distant modern societies. We also differ from past societies in some respects that put us at greater risk than them: again, our potent technology (i.e., its unintended destructive effects), globalisation (such that now a problem in one part of the world affects all the rest), the dependence of millions of us on

modern medicine for our survival, and our much larger human population. Perhaps we can still learn from the past, but only if we think carefully about its lessons.

Questions 27-29

Choose the correct letter, A, B, C or D.

Write the correct answers in boxes 27-29 on your answer sheet.

27. When the writer describes the impact of monumental ruins today, he emphasises

- A. the income they generate from tourism.
- B. the area of land they occupy.
- C. their archaeological value.
- D. their romantic appeal.

28. Recent findings concerning vanished civilisations have

- A. overturned long-held beliefs.
- B. caused controversy amongst scientists.
- C. come from a variety of disciplines.
- D. identified one main cause of environmental damage.

29. What does the writer say about ways in which former societies collapsed?

- A. The pace of decline was usually similar.
- B. The likelihood of collapse would have been foreseeable.
- C. Deterioration invariably led to total collapse.
- D. Individual citizens could sometimes influence the course of events.

Questions 30-34

Do the following statements agree with the views of the writer in section 3?

In boxes 30-34 on your answer sheet, write

- YES if the statement agrees with the claims of the writer
NO if the statement contradicts the claims of the writer
NOT GIVEN if it is impossible to say what the writer thinks about this

30. It is widely believed that environmental problems represent the main danger faced by the modern world.
31. The accumulation of poisonous substances is a relatively modern problem.
32. There is general agreement that the threats posed by environmental problems are very serious.
33. Some past societies resembled present-day societies more closely than others.
34. We should be careful when drawing comparisons between past and present.

Questions 35-39

Complete each sentence with the correct ending, A-F, below.

Write the correct letter, A-F in boxes 35 -39 on your answer sheet.

35. Evidence of the greatness of some former civilisations
36. The parallel between an individual's life and the life of a society
37. The number of environmental problems that societies face
38. The power of technology
39. A consideration of historical events and trends

- A. is not necessarily valid.
- B. provides grounds for an optimistic outlook.
- C. exists in the form of physical structures.
- D. is potentially both positive and negative.
- E. will not provide direct solutions for present problems.
- F. is greater now than in the past.

Question 40

Choose the correct letter, A, B, C or D.

40. What is the main argument of Reading Passage?

- A. There are differences as well as similarities between past and present societies.
- B. More should be done to preserve the physical remains of earlier civilisations.
- C. Some historical accounts of great civilisations are inaccurate.
- D. Modern societies are dependent on each other for their continuing survival.

Reading Test 12

SECTION 1

The Mozart Effect

A.

Music has been used for centuries to heal the body. In the Ebers Papyrus (one of the earliest medical documents, circa 1550 BC), it was recorded that physicians chanted to heal the sick (Castleman, 1994). In various cultures, we have observed singing as part of healing rituals. In the world of Western medicine, however, using music in medicine lost popularity until the introduction of the radio. Researchers then started to notice that listening to music could have significant physical effects. Therapists noticed music could help calm anxiety, and researchers saw that listening to music, could cause a drop in blood pressure. In addition to these two areas, music has been used with cancer chemotherapy to reduce nausea, during surgery to reduce stress hormone production, during childbirth, and in stroke re-recovery (Castleman, 1994 and Westley, 1998). It has been shown to decrease pain as well as enhance the effectiveness of the immune system. In Japan, compilations of music are used as medication of sorts. For example, if you want to cure a headache or a migraine, the album suggested is Mendelssohn's "Spring Song", Dvorak's "Humoresque", or part of George Gershwin's "An American in Paris" (Campbell, 1998). Music is also being used to assist in learning, in a phenomenon called the Mozart Effect.

B.

Frances H. Rauscher, PhD, first demonstrated the correlation between music and learning in an experiment in 1993. His experiment indicated that a 10-minute dose of Mozart could temporarily boost intelligence. Groups of students were given intelligence tests after listening to silence, relaxation tapes, or Mozart's "Sonata for Two Pianos in D Major" for a short time. He found that after silence, the average IQ score was 110, and after the relaxation tapes, the score rose a point. After listening to Mozart's music, however, the score jumped to 119 (Westley, 1998). Even students who did not like the music still had an increased score in the IQ test. Rauscher hypothesized that "listening to complex, non-repetitive music, like Mozart's, may stimulate neural pathways that are important in thinking" (Castleman, 1994).

C.

The same experiment was repeated on rats by Rauscher and Hong Hua Li from Stanford. Rats also demonstrated enhancement in their intelligence performance. These new studies indicate that rats that were exposed to Mozart's showed "increased gene expression of BDNF (a neural growth factor), CREB (a learning and memory compound), and Synapsin I (a synaptic growth protein)" in the brain's hippocampus, compared with rats in the control group, which heard only white noise (e.g. the whooshing sound of a V radio tuned between stations).

D.

How exactly does the Mozart Effect work? Researchers are still trying to determine the actual mechanisms for the formation of these enhanced learning pathways. Neuroscientists suspect that music can actually help build and strengthen connections between neurons in the cerebral cortex in a process similar to what occurs in brain development despite its type.

When a baby is born, certain connections have already been made - like connections for heartbeat and breathing. As new information is learned and motor skills develop, new neural connections are formed. Neurons that are not used will eventually die while those used repeatedly will form strong connections. Although a large number of these neural connections require experience, they must also occur within a certain time frame. For example, a child born with cataracts cannot develop connections within the visual cortex. If the cataracts are removed by surgery right away, the child's vision develops normally. However, after the age of 2, if the cataracts are removed, the child will remain blind because those pathways cannot establish themselves.

E.

Music seems to work in the same way. In October of 1997, researchers at the University of Konstanz in Germany found that music actually rewires neural circuits (Begley, 1996). Although some of these circuits are formed for physical skills needed to play an instrument, just listening to music strengthens connections used in higher-order thinking. Listening to music can then be thought of as "exercise" for the brain, improving concentration and enhancing intuition.

F.

If you're a little sceptical about the claims made by supporters of the Mozart Effect, you're not alone. Many people accredit the advanced learning of some children who take music lessons to other personality traits, such as motivation and persistence, which are

required in all types of learning. There have also been claims of that influencing the results of some experiments.

G.

Furthermore, many people are critical of the role the media had in turning an isolated study into a trend for parents and music educators. After the Mozart Effect was published to the public, the sales of Mozart CDs stayed on the top of the hit list for three weeks. In an article by Michael Linton, he wrote that the research that began this phenomenon (the study by re-searchers at the University of California, Irvine) showed only a temporary boost in IQ, which was not significant enough to even last throughout the course of the experiment. Using music to influence intelligence was used in Confucian civilisation and Plato alluded to Pythagorean music when he described its ideal state in *The Republic*. In both of these examples, music did not cause any overwhelming changes, and the theory eventually died out. Linton also asks, “If Mozart’s music were able to improve health, why was Mozart himself so frequently sick? If listening to Mozart’s music increases intelligence and encourages spirituality, why aren’t the world’s smartest and most spiritual people Mozart specialists?” Linton raises an interesting point, if the Mozart Effect causes such significant changes, why isn’t there more documented evidence?

H.

The “trendiness” of the Mozart Effect may have died out somewhat, but there are still strong supporters (and opponents) of the claims made in 1993. Since that initial experiment, there has not been a surge of supporting evidence. However, many parents, after playing classical music while pregnant or when their children are young, will swear by the Mozart Effect. A classmate of mine once told me that listening to classical music while studying will help with memorisation. If we approach this controversy from a scientific aspect, although there has been some evidence that music does increase brain activity, actual improvements in learning and memory have not been adequately demonstrated.

Questions 1-5

Section 1 has eight paragraphs A-H.

Which paragraph contains the following information?

Write the correct letter A-H in boxes 1-5 on your answer sheet.

1. A description of how music affects the brain development of infants

2. Public's first reaction to the discovery of the Mozart Effect
3. The description of Rauscher's original experiment
4. The description of using music for healing in other countries
5. Other qualities needed in all learning

Questions 6-8

Complete the summary below.

Choose NO MORE THAN ONE WORD from the passage for each answer.

Write your answers in boxes 6-8 on your answer sheet.

During the experiment conducted by Frances Rauscher, subjects were exposed to the music for a 6 period of time before they were tested. And Rauscher believes the enhancement in their performance is related to the 7nature of Mozart's music. Later, a similar experiment was also repeated on 8

Questions 9-13

Do the following statements agree with the information given in Reading Passage 1?

In boxes 9-13 on your answer sheet, write

TRUE if the statement agrees with the information

FALSE if the statement contradicts the information

NOT GIVEN if there is no information on this

9. All kinds of music can enhance one's brain performance to somewhat extent.
10. There is no neural connection made when a baby is born.
11. There are very few who question the Mozart Effect.
12. Michael Linton conducted extensive research on Mozart's life.
13. There is not enough evidence in support of the Mozart Effect today.

SECTION 2

Vitamins – to supplement or not

A.

Mineral, vitamin, and antioxidant health supplements make up a multi-billion-dollar industry in the United States alone, but do they really work? Evidence suggests supplementation is clearly indicated in special circumstances, but can actually be harmful in others. For the general population, however, supplements have negligible or no impact on the prevention of common cancers, cardiovascular diseases, cognitive decline, mortality, or any other major indicators of health. In pursuit of a longer, happier and healthier life, there are certainly better investments for most people than a tube of vitamin supplements.

B.

Particular sub-groups of the population can gain a proven benefit from supplementation. Folic acid has long been indicated as a prenatal supplement due to its assistance in foetal cell division and corresponding ability to prevent neural tube birth defects. Since Canada and the United States decided to require white flour to be fortified with folic acid, spinal birth defects have plummeted by 75%, and rates of neuroblastoma (a ravaging form of infant cancer) are now 50% lower. In countries without such fortification, or for women on low-carbohydrate diets, a prenatal multivitamin could make the crucial difference. The United States Department of Health and Human Services has concluded that the elderly may also benefit from extra vitamin D; calcium can help prevent bone fractures; and zinc and antioxidants can maintain vision while deflecting macular degeneration in people who would otherwise be likely to develop this affliction.

C.

There is mounting evidence, however, for many people to steer clear of multivitamins. The National Institutes of Health has noted a “disturbing evidence of risk” in tobacco users: beta-carotene, a common ingredient in multivitamins, was found over a six-year study to significantly contribute to higher lung cancer and mortality rates in smokers. Meanwhile, excessive vitamin A (a supplement often taken to boost the immune system) has been proven to increase women’s risk of a hip fracture, and vitamin E, thought to improve cardiovascular health, was contraindicated in a study that demonstrated higher rates of congestive heart failure among such vitamin users. Antioxidant supplementation has no purpose nor does it achieve anything, according to the Food and Nutrition Board

of the National Academy of Sciences, and the Medical Letter Group has gone further in suggesting they may interfere with treatment and promote some cancers. Antioxidants are generally regarded as counteracting the destructive effect of free radicals in the body, but according to the Medical Letter's theory, free radicals may also serve the purpose of sending a powerful signal to the body's immune system to fix the damage. By taking supplements, we risk undermining that message and upsetting the balance of antioxidants and free radicals in the body. The supplements counteract the free radicals, the immune system is not placed on alert, and the disease could sneak through the gates.

D.

One problem with supplementation by tablet is the poor record on digestibility. These tablets are often stocked with metal-based minerals that are essentially miniature rocks, and our bodies are unable to digest them. Even the vitamin elements of these pills that are theoretically digestible are often unable to be effectively extracted by our bodies when they arrive in such a condensed form. In Salt Lake City, for example, over 150 gallons of vitamin and mineral pills are retrieved from the sewer filters each month. According to the physician's desk reference, only about 10% – 20% of multivitamins are absorbed by the body. The National Advisory Board is even more damning, suggesting that every 100mg of tablet corresponds to about 8.3mg of blood concentration, although noting that this can still potentially perform a helpful role in some cases. In effect, for every \$100 you spend on vitamin supplements, over \$90 of that is quite literally flushed down the toilet.

E.

A final argument against multivitamins is the notion that they can lead people – consciously or not – to the conclusion that supplementation fills in the gaps of an unhealthy diet and mops up afterwards, leaving their bodies none the wiser that instead of preparing a breakfast of fresh fruit and muesli, they popped a tiny capsule with coffee and a chocolate bar. In a seven-year study, however, the Heart Protection study did not find any positive outcome whatsoever from multivitamins and concluded that while vitamins in the diet are important, multivitamin tablets are safe but completely useless. There is evidently no shortcut around the task of buying, preparing, and consuming fresh fruit and vegetables every day. Boosting, supplementing, and fortifying products alter people's very perception of what healthy food is; instead of heading for the fresh produce aisle in the supermarket, they are likely to seek out sugary, processed foods with a handful of extra B vitamins as a healthy choice. We cannot supplement our way out of a bad diet.

Questions 14-16

Choose the correct letter, A, B, C, or D. Write the correct letters in boxes 14-16 on your answer sheet.

14. The writer does not recommend multivitamin supplementation for _____

- A. pregnant woman.
- B. young children.
- C. anyone prone to eye problems.
- D. old people.

15. According to the writer, vitamin E has been shown to _____

- A. lead to heart problems.
- B. be good for heart health.
- C. support the immune system.
- D. have no effect.

16. The Medical letter Group believes antioxidant supplementation _____

- A. is ineffective in attacking free radicals.
- B. alerts the immune system to the presence of free radicals.
- C. attacks both free radicals and the immune system.
- D. prevents the immune system from responding to free radicals.

Questions 17-21

Do the following statements agree with the information given in section 2?

In boxes 17-21 on your answer sheet, write

YES if the statement agrees with the views of the writer

NO if the statement contradicts the views of the writer

NOT GIVEN if it is impossible to say what the writer thinks about this

- 17. Some multivitamin tablets have indigestible ingredients.
- 18. Some individual vitamins are better absorbed than others in a tablet form.
- 19. Our bodies cannot distinguish food-based from supplement-based vitamins.
- 20. Multivitamins can lead to poorer overall eating habits in a person's life.
- 21. People typically know that fortified processed foods are not good for them.

Questions 22-26

Classify the following groups of people according to whether they believe

Write the correct letter A, B or C, in boxes 22-26 on your answer sheet.

- A. the supplementation may have a positive effect
- B. the supplementation may have a negative effect
- C. supplementation has no effect

22. The United States Department of Health and Human Services

23. The National Institutes of Health

24. The Food and Nutrition Board of the National Academy of Sciences

25. The National Advisory Board

26. The Heart Protection Group

SECTION 3

LONG-TERM FORECAST: HOT AND DRY

A.

Melting land ice in the Arctic is set to cause a global rise in sea levels, leading to disastrous effects for both man and wildlife. Many species worldwide are threatened with extinction, and low-lying islands and landmasses will disappear entirely. But the havoc wreaked by the effect of greenhouse gases won't be confined to just too much water, but the absence of it, as well. In other words, desertification. A decrease in the total amount of rainfall in arid and semi-arid areas could increase the total area of drylands worldwide, and thus the total amount of land potentially at risk from desertification.

B.

Desertification is officially recognised as land degradation in arid, semi-arid and dry sub-humid areas resulting from various factors including climatic variations and human activities. This degradation of formerly productive land is a complex process. It involves multiple causes, and it proceeds at varying rates in different climates. Desertification may intensify a general climatic trend, or initiate a change in local climate, both leading towards greater aridity. The more arid conditions associated with desertification accelerate the depletion of vegetation and soils. Land degradation occurs all over the world, but it is only referred to as desertification when it takes place in drylands. This is because these areas are especially prone to more permanent damage as different areas of degraded land spread and merge together to form desert-like conditions.

C.

Global warming brought about by increasing greenhouse gas levels in the atmosphere is expected to increase the variability of weather conditions and extreme events. Many dryland areas face increasingly low and erratic rainfalls, coupled with soil erosion by wind and the drying-up of water resources through increased regional temperatures. Deforestation can also reduce rainfall in certain areas, increasing the threat of desertification. It is not yet possible, despite sophisticated technology, to identify with an acceptable degree of reliability those parts of the Earth where desertification will occur. Existing drylands, which cover over 40% of the total land area of the world, most

significantly in Africa and Asia, will probably be most at risk from climate change. These areas already experience low rainfall, and any that falls is usually in the form of short, erratic, high-intensity storms. In addition, such areas also suffer from land degradation due to over-cultivation, overgrazing, deforestation and poor irrigation practices.

D.

It is a misconception that droughts cause desertification. Droughts are common in arid and semi-arid lands. Well-managed lands can recover from drought when the rains return. Continued land abuse during droughts, however, increases land degradation. Nor does desertification occur in linear, easily definable patterns. Deserts advance erratically, forming patches on their borders. Areas far from natural deserts can degrade quickly to barren soil, rock, or sand through poor land management. The presence of a nearby desert has no direct relationship to desertification. Unfortunately, an area undergoing desertification is brought to public attention only after the process is well underway. Often little or no data are available to indicate the previous state of the ecosystem or the rate of degradation. Scientists still question whether desertification, as a process of global change, is permanent or how and when it can be halted or reversed.

E.

But desertification will not be limited to the drylands of Africa and Asia. According to the environmental organisation Greenpeace, the Mediterranean will suffer substantially, too. If current trends in emissions of greenhouse gases continue, global temperatures are expected to rise faster over the next century than over any time during the last 10,000 years. Significant uncertainties surround predictions of regional climate changes, but it is likely that the Mediterranean region will also warm significantly, increasing the frequency and severity of droughts across the region. As the world warms, global sea levels will rise as oceans expand and glaciers melt. Around much of the Mediterranean basin, sea levels could rise by close to 1m by 2100. As a result, some low-lying coastal areas would be lost through flooding or erosion, while rivers and coastal aquifers would become saltier. The worst affected areas will be the Nile Delta, Venice in Italy and Thessaloniki in Greece, two major cities where local subsidence means that sea levels could rise by at least one-and-a-half times as much as elsewhere.

F.

The consequences of all this say Greenpeace, are far-reaching, and the picture is a gloomy one. Livestock production would suffer due to a deterioration in the quality of rangeland. Yields of grains and other crops could decrease substantially across the Mediterranean region due to increased frequency of drought. Crop production would be further threatened by increases in competition for water and the prevalence of pests and diseases and land loss through desertification and sea-level rise. The combination of heat and pollution would lead to an upsurge in respiratory illness among urban populations, while extreme weather events could increase death and injury rates. Water shortages and damaged infrastructure would increase the risk of cholera and dysentery, while higher temperatures would increase the incidence of infectious diseases, such as malaria and dengue fever. Serious social disruption could occur as millions are forced from their homelands as a result of desertification, poor harvests and sea-level rise, while international disputes over shared water resources could turn into conflict.

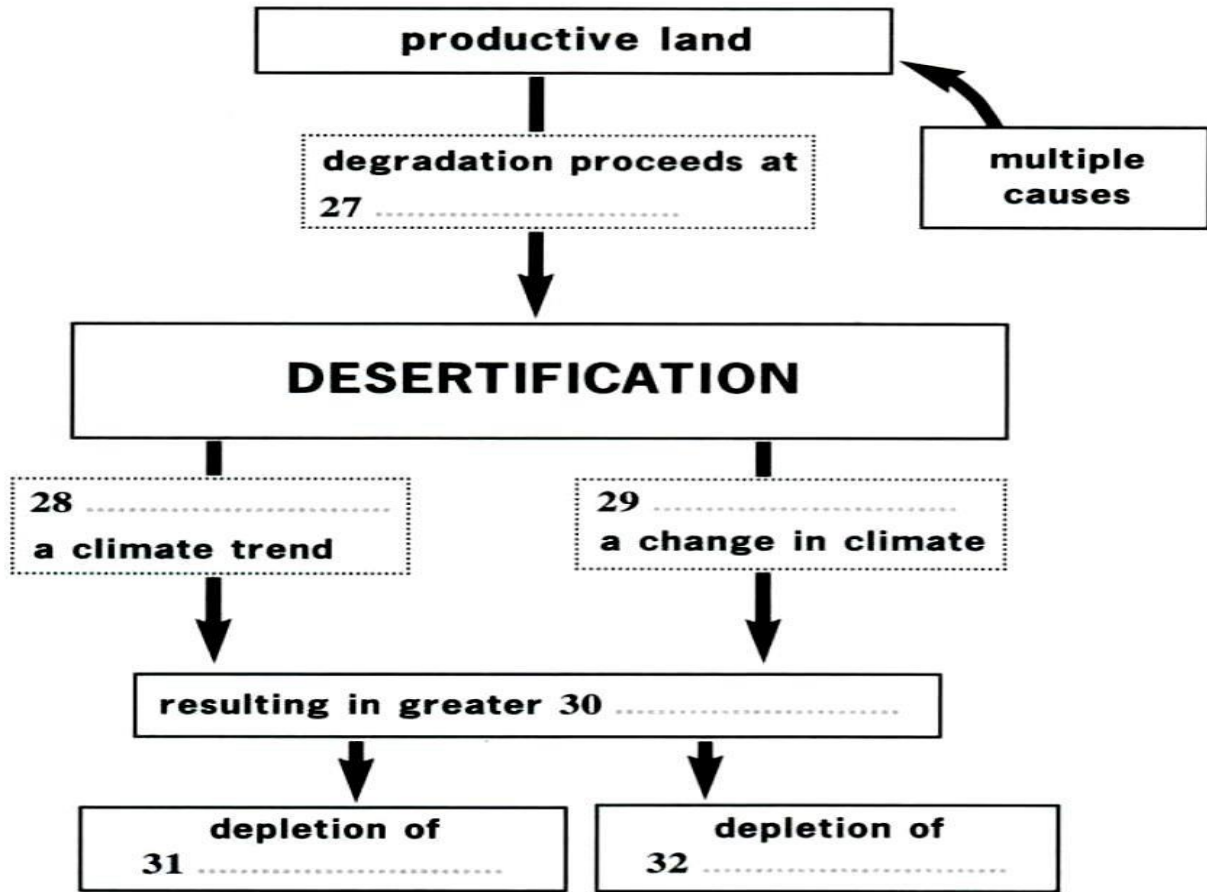

G.

Future climate change could critically undermine efforts for sustainable development in the Mediterranean region through its impacts on the environment and social and economic well-being. While in many respects climate change exacerbates existing problems instead of creating new ones, the sheer magnitude of the potential problem means it cannot be ignored. There is some scope for adaptation, but the fact that many measures would be beneficial irrespective of climate change suggests that radical changes in our policies and practices will be needed. It is also vital that developed countries meet their obligations to assist adaptation in developing countries through access to know-how and financial assistance. Ultimately, however, the long-term sustainability of the Mediterranean region requires keeping climate change within tolerable bounds. Current understanding of safe limits points to the need for prompt international agreement – and action – to make the drastic cuts in emissions of greenhouse gases required to stabilize atmospheric concentrations of these gases.

Questions 27-32

Complete the flow-chart below

Write **NO MORE THAN THREE WORDS** for each answer.

Questions 33-36

Section 3 has seven paragraphs, A-G.

Which paragraph contains the following information?

Write the correct letter A-G in boxes 33-36 on your answer sheet.

- 33. Human intervention is a potential solution to a potential disaster.
- 34. The rate of climate change is set to accelerate dramatically.
- 35. There is seldom enough information available in some areas to track how fast the effects of climate change have happened in the past.
- 36. Desertification is attributable to a number of factors.

Questions 37-40

Complete the summary with the list of words A-I below.

Write the correct letter A-I in boxes 37-40 on your answer sheet.

Climate change may have catastrophic effects on the human and animal world. As glaciers melt, sea levels will rise, causing extensive flooding and land 37..... Another consequence of global warming is 38....., which affects areas known as 39..... These areas are subject to irregular weather patterns but also suffer from human intervention or neglect, such as inadequate or inefficient 40..... systems.

- | | | |
|-------------------|-----------|------------|
| A irrigation | B cooling | C drylands |
| D cause | E loss | F abuse |
| G desertification | H deserts | I emission |

Reading Test 13

SECTION 1

Ancient Egypt

A.

The people of ancient Egypt emerged as one of the first Western civilisations. Sustained by the River Nile and protected by vast deserts, the Egyptians lived in comparative security, prosperity and peace for thousands of years. When such conditions exist, the civilisation and its arts usually flourish. To this day, many of the Egyptian artistic creations display the wealth, splendour and talent of this great civilisation.

B.

Ancient Egypt has been called a land of temples and tombs, and for centuries people have been filled with wonder at the ingenuity of the Egyptians, whose impressive works have withstood the ravages of time so well. Had it not been for the long-lasting nature of their monuments and carved inscriptions in the form of hieroglyphics, much evidence of their activities would have vanished from all historical records. In about 3000 BC, Upper and Lower Egypt were united under the first pharaoh, and generally, from that time until the invasion by Alexander the Great in 332 BC, Egypt prospered as a nation of skilful craftsmen and artists.

C.

The Egyptians were industrious, highly civilised and deeply religious people, who obediently accepted the supreme authority of their pharaohs. The people were content to serve and work for the state in return for a secure livelihood. They considered this earthly life to be a segment in a great cycle, at the end of which everything would be returned to its original form. The richer and more important the person, the more careful and elaborate would be his or her burial, and the stronger and safer the tomb in which they would be buried.

D.

The burial of the dead in the ground was not considered sufficiently safe for kings, queens and court officials, so sunken, sealed tombs were ingeniously constructed to protect personal treasures, food and instructions for the safe conduct of the soul after death. The design of these tombs developed into the stepped pyramid, and finally into the square pyramid that we know today.

E.

There are about 80 ancient pyramids in Egypt. The Great Pyramid at Gizeh, which King Cheops built as his tomb 5000 years ago, holds the most interest. It stands with two other pyramids on a slight rise overlooking the River Nile. At the centre of the pyramid is the King's Chamber and leading down from there is a long narrow area known as the Grand Gallery. The pyramid covers 13 acres and contains 2,300,000 blocks of limestone, each weighing an average of 1.5 tons. Its pyramidal form has a perfectly square base with sides of 756 feet and a height of 481 feet. Situated directly below the King's Chamber is the Queen's Chamber and there are two air channels leading upwards from the centre of the pyramid to the outside.

F.

Originally the exterior was covered in highly polished limestone slabs, all of which have been stolen over the years. It is estimated that a total of 100,000 men laboured for 20 years to build this gigantic structure, and although architecturally unimportant in design, it has aroused the curiosity of millions of people because of the uncanny accuracy of its measurements and proportions. It reveals the remarkable ingenuity and the great organising ability of the ancient Egyptians.

G.

Near these pyramids stands the Great Sphinx, the origin and purpose of which constitute one of the world's most famous puzzles. Shaped from an outcrop of stone in the form of a human-headed lion, the face is possibly a portrait of King Khafra, the son of Cheops, who was buried in the second largest pyramid. The Sphinx is one of the biggest statues ever made.

H.

The Egyptian people showed reverence towards natural objects such as the lotus flower, the scarab beetle, the falcon, the lion, the sun and the River Nile. All these subjects and many more were used symbolically and conventionally as motifs in low-relief carving and painting. It was the custom of the Egyptians to depict the various parts of the human figure, usually in the most characteristic positions. The head was shown in profile except for the eye, which was represented from the front, the shoulders and a portion of the arms were portrayed from the front, while the hips and legs were side views. Wall decoration showed little or no attempt to indicate depth or perspective, except by placing distant objects above near things. It was essentially two-dimensional, and relative size

indicated the status of the person, so the pharaoh was the largest figure in the composition.

I.

Egyptian art is characterised by a passion for permanence, a desire to impress by size, and a determination to make each item serve its function without much regard for the whole. It is obvious that art among these people reached a very high level and the strong influence of Egyptian art can be seen in the work of nearby civilisations.

J.

The fortunate discovery and subsequent deciphering in 1822 of the Rosetta Stone, which showed the same laws inscribed both in Egyptian hieroglyphics and the Egyptian demotic, or popular version of their language, as well as the Greek language, eventually gave the key to the meaning of Egyptian inscriptions, and therefore the significance of much Egyptian art.

Questions 1-3

Complete the sentences below.

Choose **NO MORE THAN THREE WORDS** from the passage for each answer.

Write your answers in boxes 1-3 on your answer sheet.

1. Security and peace are two..... that are necessary for a civilisation to be successful.
2. Ancient Egyptians worked as both.....
3. Ordinary Egyptians expected to receivefor their hard work.

Questions 4-7

Label the diagram below.

Choose **NO MORE THAN THREE WORDS AND/OR NUMBERS** from the passage for each answer.

Write your answers in boxes 4-7 on your answer sheet.

- 4
- 5
- 6
- 7

Questions 8-12

Do the following statements agree with the information given in the Section 1.

In boxes 8-12 on your answer sheet, write

TRUE if the statement agrees with the information
 FALSE if the statement contradicts the information
 NOT GIVEN if there is no information on this

- 8. The surface of the Great Pyramid is covered in polished limestone slabs.
- 9. King Khafra died before King Cheops.
- 10. Egyptian carvings were often based on things found in nature.
- 11. Important characters in Egyptian carvings were bigger than less important characters.
- 12. Egyptian art was greatly influenced by the art of neighbouring cultures.

Question 13

Choose the correct letter, - A, B, C or D.

Write the correct letter in box 13 on your answer sheet.

The writer's aim in this passage is to --

- A. describe the construction methods of the pyramids.
- B. explain the beliefs of the ancient Egyptians.
- C. offer an interpretation of Egyptian art and sculpture.
- D. provide an overview of early Egyptian society.

SECTION 2

Stress of Workplace

A.

How busy is too busy? For some it means having to miss the occasional long lunch; for others it means missing lunch altogether. For a few, it is not being able to take a “sickie” once a month. Then there is a group of people for whom working every evening and weekend is normal, and frantic is the tempo of their lives. For most senior executives, workloads swing between extremely busy and frenzied. The vice-president of the management consultancy AT Kearney and its head of telecommunications for the Asia-Pacific region, Neil Plumridge, says his work weeks vary from a “manageable” 45 hours to 80 hours, but average 60 hours.

B.

Three warning signs alert Plumridge about his workload: sleep, scheduling and family. He knows he has too much on when he gets less than six hours of sleep for three consecutive nights; when he is constantly having to reschedule appointments; “and the third one is on the family side”, says Plumridge, the father of a three-year-old daughter, and expecting a second child in October. “If I happen to miss a birthday or anniversary, I know things are out of control.” Being “too busy” is highly subjective. But for any individual, the perception of being too busy over a prolonged period can start showing up as stress: disturbed sleep, and declining mental and physical health. National workers’ compensation figures show stress causes the most lost time of any workplace injury. Employees suffering stress are off work an average of 16.6 weeks. The effects of stress are also expensive. Comcare, the Federal Government insurer, reports that in 2003-04, claims for psychological injury accounted for 7% of claims but almost 27% of claim costs. Experts say the key to dealing with stress is not to focus on relief – a game of golf or a massage – but to reassess workloads. Neil Plumridge says he makes it a priority to work out what has to change; that might mean allocating extra resources to a job, allowing more time or changing expectations. The decision may take several days. He also relies on the advice of colleagues, saying his peers’ coach each other with business problems. “Just a fresh pair of eyes over an issue can help,” he says.

C.

Executive stress is not confined to big organisations. Vanessa Stoykov has been running her own advertising and public relations business for seven years, specialising in work

for financial and professional services firms. Evolution Media has grown so fast that it debuted on the BRW Fast 100 list of fastest-growing small enterprises last year – just after Stoykov had her first child. Stoykov thrives on the mental stimulation of running her own business. “Like everyone, I have the occasional day when I think my head’s going to blow off,” she says. Because of the growth phase the business is in, Stoykov has to concentrate on short-term stress relief – weekends in the mountains, the occasional “mental health” day – rather than delegating more work. She says: “We’re hiring more people, but you need to train them, teach them about the culture and the clients, so it’s actually more work rather than less.”

D.

Identify the causes: Jan Elsner, Melbourne psychologist who specialises in executive coaching, says thriving on a demanding workload is typical of senior executives and other high-potential business people. She says there is no one-size-fits-all approach to stress: some people work best with high-adrenalin periods followed by quieter patches, while others thrive under sustained pressure. “We could take urine and blood hormonal measures and pass a judgment of whether someone’s physiologically stressed or not,” she says. “But that’s not going to give us an indicator of what their experience of stress is, and what the emotional and cognitive impacts of stress are going to be.”

E.

Eisner’s practice is informed by a movement known as positive psychology, a school of thought that argues “positive” experiences – feeling engaged, challenged, and that one is making a contribution to something meaningful – do not balance out negative ones such as stress; instead, they help people increase their resilience over time. Good stress, or positive experiences of being challenged and rewarded, is thus cumulative in the same way as bad stress. Elsner says many of the senior business people she coaches are relying more on regulating bad stress through methods such as meditation and yoga. She points to research showing that meditation can alter the biochemistry of the brain and actually help people “retrain” the way their brains and bodies react to stress. “Meditation and yoga enable you to shift the way that your brain reacts, so if you get proficient at it you’re in control.”

F.

The Australian vice-president of AT Kearney, Neil Plumridge, says: “Often stress is caused by our setting unrealistic expectations of ourselves. I’ll promise a client I’ll do something tomorrow, and then promise another client the same thing, when I really know it’s not going to happen. I’ve put stress on myself when I could have said to the clients:

‘Why don’t I give that to you in 48 hours?’ The client doesn’t care.” Over-committing is something people experience as an individual problem. We explain it as the result of procrastination or Parkinson’s law: that work expands to fill the time available. New research indicates that people may be hard-wired to do it.

G.

A study in the February issue of the Journal of Experimental Psychology shows that people always believe they will be less busy in the future than now. This is a misapprehension, according to the authors of the report, Professor Gal Zauberman, of the University of North Carolina, and Professor John Lynch, of Duke University. “On average, an individual will be just as busy two weeks or a month from now as he or she is today. But that is not how it appears to be in everyday life,” they wrote. “People often make commitments long in advance that they would never make if the same commitments required immediate action. That is, they discount future time investments relatively steeply.” Why do we perceive a greater “surplus” of time in the future than in the present? The researchers suggest that people underestimate completion times for tasks stretching into the future, and that they are bad at imagining future competition for their time.

Questions 14-18

Use the information in the passage to match the people (listed A-D) with opinions or deeds below.

Write the correct letter A-D, in boxes 14-18 on your answer sheet.

NB You may use any letter more than once.

- A. Jan Elsnera
- B. Vanessa Stoykov
- C. Gal Zauberman
- D. Neil Plumridge

- 14. Work stress usually happens in the high level of a business.
- 15. More people’s ideas involved would be beneficial for stress relief
- 16. Temporary holiday sometimes doesn’t mean less work.
- 17. Stress leads to the wrong direction when trying to satisfy customers.
- 18. It is not correct that stress in the future will be eased more than now.

Questions 19-21

Choose the correct letter, A, B, C or D.

Write your answers in boxes 19-21 on your answer sheet.

19. Which of the following workplace stress is NOT mentioned according to Plumridge in the following option?

- A. Not enough time spend on family
- B. Unable to concentrate on work
- C. Inadequate time of sleep
- D. Alteration of appointment

20. Which of the following solution is NOT mentioned in helping reduce the work pressure according to Plumridge?

- A. Allocate more personnel
- B. Increase more time
- C. Lower expectation
- D. Do sports and massage

21. What is the point of view of Jan Elsnera towards work stress?

- A. Medical test can only reveal part of the date needed to cope with stress
- B. Index somebody samples will be abnormal in a stressful experience
- C. Emotional and cognitive affection is superior to a physical one
- D. One well a designed solution can release all stress

Questions 22-25

Complete the following summary of the paragraphs of Reading Passage

Using **NO MORE THAN TWO WORDS** from the Reading Passage for each answer.

Write your answers in boxes 22-27 on your answer sheet.

Statistics from National worker's compensation indicate stress plays the most important role in 22..... which cause the time losses. Staffs take about

23..... for absence from work caused by stress. Not just time is our main concern but great expenses generated consequently. An official insurer wrote sometime that about 24.....of all claims were mental issues whereas nearly 27% costs in all claims. Sports such as 25.....

SECTION 3

Toddlers Bond with Robot

A.

Will the robot revolution begin in nursery school? Researchers introduced a state-of-the-art social robot into a classroom of 18- to 24-month-olds for five months as a way of studying human-robot interactions. The children not only came to accept the robot, but treated it as they would a human buddy - hugging it and helping it - a new study says. "The results imply that current robot technology is surprisingly close to achieving autonomous bonding and socialization with human toddlers," said Fumihide Tanaka, a researcher at the University of California, San Diego

B.

The development of robots that interact socially with people has been difficult to achieve, experts say, partly because such interactions are hard to study. "To my knowledge, this is the first long-term study of this sort," said Ronald Arkin, a roboticist at the Georgia Institute of Technology, who was not involved with the study. "It is groundbreaking and helps to forward human-robot interaction studies significantly," he said.

C.

The most successful robots so far have been storytellers, but they have only been able to hold human interest for a limited time. For the new study, researchers introduced a toddler-size humanoid robot into a classroom at a UCSD childhood education center. Initially the researchers wanted to use a 22-inch-tall model, but later they decided to use another robot of the QRIO series, the 23-inch-tall (58-centimeter-tall) machine was originally developed by Sony. Children of toddler age were chosen because they have no preconceived notions of robots, said Tanaka, the lead researcher, who also works for Sony. The researchers sent instructions about every two minutes to the robot to do things like giggle, dance, sit down, or walk in a certain direction. The 45 sessions were videotaped, and interactions between toddlers and the robot were later analyzed.

D.

The results showed that the quality of those interactions improved steadily over 27 sessions. The tots began to increasingly interact with the robot and treat it more like a peer than an object during the first 11 sessions. The level of social activity increased dramatically when researchers added a new behavior to QRIO's repertoire: If a child touched the humanoid on its head, it would make a giggling noise. The interactions deteriorated quickly over the next 15 sessions, when the robot was reprogrammed to behave in a more limited, predictable manner. Finally, the human-robot relations improved in the last three sessions, after the robot had been reprogrammed to display its full range of behaviors. "Initially the children treated the robot very differently than the way they treated each other," Tanaka said. "But by the end they treated the robot as a peer rather than a toy."

E.

Early in the study some children cried when QRIO fell. But a month into the study, the toddlers helped QRIO stand up by pushing its back or pulling its hands. "The most important aspect of interaction was touch", Tanaka said. "At first the toddlers would touch the robot on its face, but later on they would touch only on its hands and arms, like they would with other humans". Another robotlike toy named Robby, which resembled QRIO but did not move, was used as a control toy in the study. While hugging of QRIO increased, hugging of Robby decreased throughout the study. Furthermore, when QRIO laid down on the floor as its batteries ran down, a toddler would put a blanket over his silver-colored "friend" and say "night-night."

F.

"Our work suggests that touch integrated on the time-scale of a few minutes is a surprisingly effective index of social connectedness," Tanaka says. "Something akin to this index may be used by the human brain to evaluate its own sense of social well-being." He adds that social robots like QRIO could greatly enrich classrooms and assist teachers in early learning programs. Hiroshi Ishiguro - robotics expert at Osaka University in Japan - says, "I think this study has clearly reported the possibilities of small, almost autonomous humanoid robots for toddlers. Nowadays robots can perform a variety of functions that were thought to be incident to people only - in short time we'll have electronic baby-sitters and peer-robots in every kindergarten," said Ishiguro, who was not involved with the study but has collaborated with its authors on other projects.

G.

Now this study has taken a new direction - the researchers are now developing autonomous robots for the toddler classroom. "I cannot avoid underlining how great potential it could have in educational settings assisting teachers and enriching the classroom environment," Tanaka said. However, some scientists don't share his opinion.

H.

Arkin, the Georgia Tech roboticist, said he was not surprised by the affection showed by the toddlers toward the robot. "Humans have a tremendous propensity to bond with artifacts with any or all sort, whether it be a car, a doll, or a robot," he said. But he also cautioned that researchers don't yet understand the consequences of increased human-robot interaction. "Just studying how robots and humans work together can give us insight into whether this is a good thing or a bad thing for society," Arkin said. "What are the consequences of introducing a robot artifact into a cadre of children? How will that enhance, or potentially interfere with, their social development? It might make life easier for the teacher, but we really don't understand the long-term impact of having a robot as a childhood friend, do we?"

Questions 26-32

Section 3 has eight paragraphs, A-H.

Which paragraph contains the following information?

Write the correct letter, A-H, in boxes 26-32 on your answer sheet. You may use any letter more than once.

26. Changes in toddler-robot interactions quality.
27. Comparison of two different robots.
28. The fact that previous robots could maintain people's interest only for a short time.
29. The importance of touch.
30. The new direction of the study.
31. Technical parameters of the introduced robot.
32. The significance and novelty of the conducted study.

Questions 33-37

Connect each of the statements below with the name of scientist who expressed it.

Answer A, B, or C to questions 33-37.

- A. Fumihide Tanaka
- B. Ronald Arkin
- C. Hiroshi Ishiguro

- 33. Robots will perform duties of baby-sitters in the nearest future.
- 34. By the end of the study children treated the robot as a living creature rather than a toy.
- 35. The long-term impact of having a robot as a childhood friend can be negative.
- 36. The conducted study is the first major study of this sort.
- 37. Robots can be used in classrooms and assist teachers.

Questions 38-40

Choose the correct letter, A, B, C or D.

Write the correct letter in boxes 38-40 on your answer sheet.

- 38. For the study, researchers introduced a toddler-size humanoid robot that was
 - A. 58-inch-tall
 - B. 22-inch-tall
 - C. 23-inch-tall
 - D. 45-inch-tall

- 39. The researchers sent instructions to the robot to perform different actions EXCEPT
 - A. laugh
 - B. dance
 - C. sit down
 - D. crawl

- 40. The toddlers began to increasingly interact with the robot during
 - A. the first 11 sessions
 - B. the next 15 sessions
 - C. the first 27 sessions
 - D. the last 15 sessions

Reading Test 14

SECTION 1

The History of Woodlands in Britain

A.

The climate in Britain has been arctic for the last several million years, punctuated by relatively warm timespans, or interglacial of thousands of years, one of which we are in as of now. Since the last glaciation, British woodland history is considered quite short in terms of geological time spans, and is also closely related to the human civilization developing.

B.

At the peak of the last glaciation (100,000 – 12,000 BC), the majority of Britain would have had no trees. Birch and willow scrub may have grown along the lower reaches of the ice, with pine in some areas. It's possible that remnants of pre-glacial flora were sheltered along the western bays of Great Britain and Ireland's coasts, but as far as the southern parts of England, the ice kept any land barren. Information regarding the development of Britain's flora following glaciation can be found by studying the deposits of pollen and seed in peat, as well as by the use of radiocarbon dating. Tundra and moorland followed the retreating ice, which lead to phases of different tree species spreading from the south. First came birch, aspen and willow, followed by pine and hazel continuing to spread north as of 8500 BC, replacing birch to make it less commonly found for the next few thousand years. Oak and alder came after pine, then lime, elm, beech, and maple, all spreading northwards one after the other. From the moment lime arrived, in about 7300, to about 4500 BC the climate remained stable for a length of time known as the Atlantic Period, a time in which numerous species grew to form a series of wildwood or wilderness types.

C.

What did the wilderness or wildwood look like, before man started interfering with it? One theory holds that Britain and Western Europe in Palaeolithic times was covered from coast to coast in a wildwood of continuous trees. However, a modern theory proposed by Francis Vera holds that Western Europe wilderness was a combination of grassland, scrub, and clusters or groves of trees. It was not a dense, impassable wildwood, but instead, an area similar to a park, kept up by wild herbivores eating the plants and grass. Throughout earlier interglacial periods, this may also have been the case in Britain, as

creatures of the Palaeolithic era needed to roam large areas of grassland to survive. A variety of grassland plants continued to live there in the last interglacial, as according to pollen records. However, since the last glaciation, the bison, elk and other large herbivores which persisted on mainland Europe were extinct in Britain, so Vera's theory may not apply so well to Britain.

D.

Meanwhile, throughout the period since it's spread northwards after the last glaciation, the sustained growth of oak in Britain demonstrates that the wildwood was not as continual as once believed. Oak is a pioneer species, which requires vacant space to generate more of itself. Grazing animals are also present to keep areas open, so Oak regenerates in the thorny brush as a protective measure from their grazing. Archaeological evidence indicates that red deer, who graze on grass as well as browse from trees, were essential to the economy in Mesolithic Britain, with people utilizing them for meat, skins, antlers and bones.

E.

As the Mesolithic (10,000-3000 BC) era ended, evidence of the beginnings of agriculture emerges. Agricultural weeds, such as plantain and stinging nettle, were also increasing in number. Nearly all the wildwood was cut down as the population increased rapidly. However, the falling elm population around 4,000 BC all across Europe has been attributed not to the clearing of trees, but to what's referred to as Elm disease.

F.

Throughout the Bronze Age (2400-750 BC), people were cutting down trees more than ever before, until the prevalence of the practice "coppicing" peaked, likely at some point during the early Iron Age. Oliver Rackham (1990) theorizes that nearly 50% of land throughout England was no longer wildwood by 500 BC. The regrowth from a stump grows more readily than the original tree, and Neolithic man had discovered this practice, known as coppicing. Much of the remaining woods were maintained by way of this method during the Bronze Age.

G.

The Celtic peoples living in the Iron Age were able to master woodworking as an artform. Today, Celtic woodworking can be seen in houses, boats, wheels and other artifacts of the time. Coppicing as a means to manage woodland was of massive importance throughout two millennia that followed. Buildings, roads, fences, carts, and the fuel for

heating, cooking, metalworking and pottery were all made possible due to wood materials gained from the vital practice of coppicing.

H.

A clear divide has existed between wooded and non-wooded regions of Britain since the time of the Romans. As evidenced by The Domesday Book (1086), all the wood in England had an economic value and was the property of either an individual or community owner. Woods were the territories, or 'exclaves' of communities who lived some miles away. Even though it had to be transported over long distances, the materials which woodlands produced were of obvious value, and their ownership was long before established. Merely around 15% of land in England was represented by woodland or wood-pasture in the year 1086.

I.

English woodlands produced mostly underwood used as fuel along with other things, with small oaks being used to construct buildings. The average wood-framed houses of the Medieval era mostly used oaks shorter than 18" in diameter. Longer pieces of timber were hard to come by, and kept only for elaborate buildings intended for the Church. Imported boards of thin oak or wainscot from Central Europe were brought in for the purpose of domestic building. Woodland cover was as low as 15% in 1086, and continued to decline from as a result of an ever-growing population to 10% by 1350. This stopped suddenly with the plague of the Black Death of 1349 wiping out some of the human population. Woods which had persisted up to 1350 mostly prospered over the next 500 years.

Questions 1-9

Do the following statements agree with the information given in the reading passage? In boxes 1-9 on your answer sheet, write

TRUE if the statement agrees with the information

FALSE if the statement contradicts the information

NOT GIVEN if there is no information on this.

1. An understanding of Britain's pre-glacial flora's development has been deduced from studies of pollen and seed deposits in peat.
2. Various species of wildwood types began growing in Britain in around the year 8500 BC.
3. Beech and lime did not spread beyond southern Britain.

4. The extinction of large herbivores in Europe adds to speculation that Vera's theory might not be as applicable to Britain.
5. The persistence of oak in Britain supports Francis Vera's theory.
6. The sharp decline in elm around 4000 BC is more likely to be the result of clearance than elm disease.
7. The first evidence of clearance of land for agriculture appears at the end of the Bronze Age.
8. The practice of coppicing is traceable back to the Neolithic period.
9. The Black Death negatively impacted growth of forests of Europe.

Questions 10-14

Look at the following items (Questions 10-14) and a list of periods of time below.

Match each item with the period of time it best corresponds with

Write the correct number A-F in boxes Questions 10-14 on your answer sheet.

NB You may use any letter more than once.

- A list of periods of time
1. The Palaeolithic era
 2. The Bronze age
 3. The Iron age
 4. The Medieval era
 5. The Mesolithic age
 6. Roman times

10. Every type of wood in England belonged to some person or some community.
11. People used woodworking to create elaborate boats, houses, and wheels.
12. Animals kept expansive areas of land clear without human interference.
13. Coppicing was first used for woodland management.
14. Houses were made with short pieces of wood, and longer pieces were used for religious buildings.

SECTION 2

The Ingenuity Gap

A. Ingenuity, as I define it here, consists not only of ideas for new technologies like computers or drought-resistant crops but, more fundamentally, of ideas for better institutions and social arrangements, like efficient markets and competent governments.

B. How much and what kinds of ingenuity a society requires depends on a range of factors, including the society's goals and the circumstances within which it must achieve those goals—whether it has a young population or an ageing one, an abundance of natural resources or a scarcity of them, an easy climate or a punishing one, whatever the case may be.

C. How much and what kinds of ingenuity a society supplies also depends on many factors, such as the nature of human inventiveness and understanding, the rewards an economy gives to the producers of useful knowledge, and the strength of political opposition to social and institutional reforms.

D. A good supply of the right kind of ingenuity is essential, but it isn't, of course, enough by itself. We know that the creation of wealth, for example, depends not only on an adequate supply of useful ideas but also on the availability of other, more conventional factors of production, like capital and labor. Similarly, prosperity, stability and justice usually depend on the resolution, or at least the containment, of major political struggles over wealth and power. Yet within our economies ingenuity often supplants labor, and growth in the stock of physical plant is usually accompanied by growth in the stock of ingenuity. And in our political systems, we need great ingenuity to set up institutions that successfully manage struggles over wealth and power. Clearly, our economic and political processes are intimately entangled with the production and use of ingenuity.

E. The past century's countless incremental changes in our societies around the planet, in our technologies and our interactions with our surrounding natural environments, have accumulated to create a qualitatively new world. Because these changes have accumulated slowly, it's often hard for us to recognize how profound and sweeping they've been. They include far larger and denser populations; much higher per capita consumption of natural resources; and far better and more widely available technologies for the movement of people, materials, and especially information.

F. In combination, these changes have sharply increased the density, intensity, and pace of our interactions with each other; they have greatly increased the burden we place on our natural environment; and they have helped shift power from national and international

institutions to individuals in subgroups, such as political special interests and ethnic factions.

G. As a result, people in all walks of life—from our political and business leaders to all of us in our day-to-day—must cope with much more complex, urgent, and often unpredictable circumstances. The management of our relationship with this new world requires immense and ever-increasing amounts of social and technical ingenuity. As we strive to maintain or increase our prosperity and improve the quality of our lives, we must make far more sophisticated decisions, and in less time, than ever before.

H. When we enhance the performance of any system, from our cars to the planet's network of financial institutions, we tend to make it more complex. Many of the natural systems critical to our well-being, like the global climate and the oceans, are extraordinarily complex, to begin with. We often can't predict or manage the behavior of complex systems with much precision, because they are often very sensitive to the smallest of changes and perturbations, and their behavior can flip from one mode to another suddenly and dramatically. In general, as the human-made and natural systems, we depend upon becoming more complex, and as our demands on them increase, the institutions and technologies we use to manage them must become more complex too, which further boosts our need for ingenuity.

I. The good news, though, is that the last century's stunning changes in our societies and technologies have not just increased our need for ingenuity; they have also produced a huge increase in its supply. The growth and urbanization of human populations have combined with astonishing new communication and transportation technologies to expand interactions among people and produce larger, more integrated, and more efficient markets. These changes have, in turn, vastly accelerated the generation and delivery of useful ideas.

J. But—and this is the critical “but”—we should not jump to the conclusion that the supply of ingenuity always increases in lockstep with our ingenuity requirement: while it's true that necessity is often the mother of invention, we can't always rely on the right kind of ingenuity appearing when and where we need it. In many cases, the complexity and speed of operation of today's vital economic, social, and ecological systems exceed the human brain's grasp. Very few of us have more than a rudimentary understanding of how these systems work. They remain fraught with countless “unknown unknowns,” which makes it hard to supply the ingenuity we need to solve problems associated with these systems.

K. In this book, I explore a wide range of other factors that will limit our ability to supply the ingenuity required in the coming century. For example, many people believe that new

communication technologies strengthen democracy and will make it easier to find solutions to our societies' collective problems, but the story is less clear than it seems. The crush of information in our everyday lives is shortening our attention span, limiting the time we have to reflect on critical matters of public policy, and making policy arguments more superficial.

L. Modern markets and science are an important part of the story of how we supply ingenuity. Markets are critically important because they give entrepreneurs an incentive to produce knowledge. As for science, although it seems to face no theoretical limits, at least in the foreseeable future, practical constraints often slow its progress. The cost of scientific research tends to increase as it delves deeper into nature. And science's rate of advance depends on the characteristic of the natural phenomena it investigates, simply because some phenomena are intrinsically harder to understand than others, so the production of useful new knowledge in these areas can be very slow. Consequently, there is often a critical time lag between the recognition between a problem and the delivery of sufficient ingenuity, in the form of technologies, to solve that problem. Progress in the social sciences is especially slow, for reasons we don't yet understand; but we desperately need better social scientific knowledge to build the sophisticated institutions today's world demands.

Questions 15-18

Complete each sentence with the appropriate answer, A, B, C, or D.
Write the correct answer in boxes 15-18 on your answer sheet

15. The definition of ingenuity
16. The requirement for ingenuity
17. The creation of social wealth
18. The stability of society

- A. depends on many factors including climate.
- B. depends on the management and solution of disputes.
- C. is not only of technological advance but more of institutional renovation.
- D. also depends on the availability of some traditional resources.

Questions 19-21

Choose the correct letter, A, B, C or D.
Write your answers in boxes 19-21 on your answer sheet

19. What does the author say about the incremental change of the last 100 years?

- A. It has become a hot scholastic discussion among environmentalists.
- B. Its significance is often not noticed.
- C. It has reshaped the natural environments we live in.
- D. It benefited a much larger population than ever.

20. The combination of changes has made life:

- A. easier
- B. faster
- C. slower
- D. less sophisticated

21. What does the author say about the natural systems?

- A. New technologies are being developed to predict change with precision.
- B. Natural systems are often more sophisticated than other systems.
- C. Minor alterations may cause natural systems to change dramatically.
- D. Technological developments have rendered human being more independent of natural systems.

Questions 22-28

Do the following statements agree with the information given in the Reading Passage?

In boxes 22-28 on your answer sheet, write

- TRUE if the statement agrees with the information
- FALSE if the statement contradicts the information
- NOT GIVEN if there is no information on this

- 22. The demand for ingenuity has been growing during the past 100 years.
- 23. The ingenuity we have may be inappropriate for solving problems at hand.
- 24. There are very few who can understand the complex systems of the present world.
- 25. More information will help us to make better decisions.
- 26. The next generation will blame the current government for their conduct.
- 27. Science tends to develop faster in certain areas than others.
- 28. Social science develops especially slowly because it is not as important as natural science.

SECTION 3

Questions 29-32

Reading Passage 3 has seven sections, A-G.

Choose the correct heading for sections B-E and G from the list of headings below.

Write the correct number, i-ix, in boxes 28-32 on your answer sheet.

List of Headings

- i An application of short codes on the TV screen
- ii An overview of a fast-growing business
- iii The trend that profitable games are gaining more concerns
- iv Why Netherlands takes the leading role
- v A new perspective towards sharing the business opportunities
- vi Factors relevant to the rapid increase in interactive TV
- vii The revenue gains and bonus share
- viii The possibility of the complex technology replaced by the simpler ones
- ix The mind change of set-top box providers

Example Answer

Section A ii

29. Section C

30. Section D

31. Section E

Example Answer

Section F ix

32. Section G

Texting the Television

A.

Once upon a time, if a television show with any self-respect wanted to target a young audience, it needed to have an e-mail address. However, in Europe's TV shows, such

addresses are gradually substituted by telephone numbers so that audiences can text the show from their mobile phones. Therefore, it comes as no shock that according to Gartner's research, texting has recently surpassed Internet usage across Europe. Besides, among the many uses of text messaging, one of the fastest-growing uses is to interact with television. The statistics provided by Gartner can display that 20% of French teenagers, 11% in Britain and 9% in Germany have responded to TV programmes by sending a text message.

B.

This phenomenon can be largely attributed to the rapid growth of reality TV shows such as 'Big Brother', where viewers get to decide the result through voting. The majority of reality shows are now open to text-message voting, and in some shows like the latest series of Norway's 'Big Brother', most votes are collected in this manner. But TV-texting isn't just about voting. News shows encourage viewers to comment by texting messages; game shows enable the audience to be part of the competition; music shows answer requests by taking text messages; and broadcasters set up on-screen chatrooms. TV audiences tend to sit on the sofa with their mobile phones right by their sides, and 'it's a supernatural way to interact.' says Adam Daum of Gartner.

C.

Mobile service providers charge appreciable rates for messages to certain numbers, which is why TV-texting can bring in a lot of cash. Take the latest British series of 'Big Brother' as an example. It brought about 5.4m text-message votes and £1.35m (\$2,1m) of profit. In Germany, MTV's 'Videoclash' encourages the audience to vote for one of two rival videos, and induces up to 40,000 texts per hour, and each one of those texts costs €0.30 (\$0.29), according to a consultancy based in Amsterdam. The Belgian quiz show '1 Against 100' had an eight-round texting match on the side, which brought in 110,000 participants in one month, and each of them paid €0.50 for each question. In Spain, a cryptic-crossword clue invites the audience to send their answers through text at the expense of €1, so that they can be enrolled in the poll to win a €300 prize. Normally, 6,000 viewers would participate within one day. At the moment, TV-related text messaging takes up a considerable proportion of mobile service providers' data revenues. In July, Mm02 (a British operator) reported an unexpectedly satisfactory result, which could be attributed to the massive text waves created by 'Big Brother'. Providers usually own 40%-50% of the profits from each text, and the rest is divided among the broadcaster, the programme producer and the company which supplies the message-processing technology. So far, revenues generated from text messages have been an indispensable part of the business model for various shows. Obviously, there has been grumbling that the providers take too much of the share. Endemol, the Netherlands-

based production firm that is responsible for many reality TV, shows including 'Big Brother', has begun constructing its own database for mobile-phone users. It plans to set up a direct billing system with the users and bypass the providers.

D.

How come the joining forces of television and text message turn out to be this successful? One crucial aspect is the emergence of one-of-a-kind four-, five- or six-digit numbers known as 'short codes'. Every provider has control over its own short codes, but not until recently have they come to realise that it would make much more sense to work together to offer short codes compatible with all networks. The emergence of this universal short codes was a game-changer, because short codes are much easier to remember on the screen, according to Lars Becker of Flytxt, a mobile-marketing company.

E.

Operators' co-operation on enlarging the market is by a larger trend, observes Katrina Bond of Analysys, a consultancy. When challenged by the dilemma between holding on tight to their margins and permitting the emergence of a new medium, no provider has ever chosen the latter WAP, a technology for mobile-phone users to read cut-down web pages on their screens, failed because of service providers' reluctance towards revenue sharing with content providers. Now that they've learnt their lesson, they are altering the way of operating. Orange, a French operator, has come such a long way as to launch a rate card for sharing revenue of text messages, a new level of transparency that used to be unimaginable.

F.

At a recent conference, Han Weegink of CMG, a company that offers the television market text-message infrastructure, pointed out that the television industry is changing in a subtle yet fundamental way. Instead of the traditional one-way presentation, more and more TV shows are now getting viewers' reactions involved. Certainly, engaging the audiences more has always been the promise of interactive TV. An interactive TV was originally designed to work with exquisite set-top devices, which could be directly plugged into the TV. However, as Mr Daum points out, that method was flawed in many ways. Developing and testing software for multiple and incompatible types of set-top box could be costly, not to mention that the 40% (or lower) market penetration is below that of mobile phones (around 85%). What's more, it's quicker to develop and set up apps for mobile phones. 'You can approach the market quicker, and you don't have to go through

as many greedy middlemen,' Mr Daum says. Providers of set-top box technology are now adding texting function to the design of their products.

G.

The triumph of TV-related texting reminds everyone in the business of how easily a fancy technology can all of a sudden be replaced by a less complicated, lower-tech method. That being said, the old-fashioned approach to interactive TV is not necessarily over; at least it proves that strong demands for interactive services still exist. It appears that the viewers would sincerely like to do more than simply staring at the TV screen. After all, couch potatoes would love some thumb exercises.

Questions 33-35

Choose the correct letter, A, B, C or D.

Write the correct letter in boxes 33-35 on your answer sheet.

33. In Europe, a research hints that young audiences spend more money on

- A. thumbing text messages.
- B. writing e-mails.
- C. watching TV programmes.
- D. talking through mobile phones.

34. What would happen when reality TV shows invite the audience to vote?

- A. Viewers would get attractive bonus.
- B. They would be part of the competition.
- C. Their questions would be replied.
- D. Their participation could change the result.

35. Interactive TV will change from concentrating on set-top devices to

- A. increasing their share in the market.
- B. setting up a modified set-top box.
- C. building an embedded message platform.
- D. marching into the European market.

Questions 36-40

Look at the following descriptions (Questions 36-40) and the list of companies below. Match each description with the correct company, A-F.

Write the correct letter, A-F, in boxes 36-40 on your answer sheet.

List of Companies

- A. Flytxt
- B. Analysys
- C. Endemol
- D. CMG
- E. Mm02
- F. Gartner

- 36. offered mobile phone message technology
- 37. earned considerable amount of money through a famous programme
- 38. expressed the view that short codes are convenient to remember when turning up
- 39. built their own mobile phone operating applications
- 40. indicated that it is easy for people to send message in an interactive TV

Reading Test 15

SECTION 1

Sustainable architecture - lessons from the ant

Termite mounds were the inspiration for an innovative design in sustainable living

A.

Africa owes its termite mounds a lot. Trees and shrubs take root in them. Prospectors mine them, looking for specks of gold carried up by termites from hundreds of metres below. And of course, they are a special treat to aardvarks and other insectivores.

B.

Now, Africa is paying an offbeat tribute to these towers of mud. The extraordinary Eastgate Building in Harare, Zimbabwe's capital city, is said to be the only one in the world to use the same cooling and heating principles as the termite mound.

C.

Termites in Zimbabwe build gigantic mounds inside which they farm a fungus that is their primary food source. This must be kept at exactly 30.5°C, while the temperatures on the African yield outside can range from 1.5°C at night only just above freezing to a baking hot 40°C during the day. The termites achieve this remarkable feat by building a system of vents in the mound. Those at the base lead down into chambers cooled by wet mud carried up from water tables far below, and others lead up through a Hue to the peak of the mound. By constantly opening and closing these heating and cooling vents over the course of the day the termites succeed in keeping the temperature constant in spite of the wide fluctuations outside.

D.

Architect Mick Pearce used precisely the same strategy when designing the Eastgate Building, which has no air conditioning and virtually no heating. The building the country's largest commercial and shopping complex uses less than 10% of the energy of a conventional building ns size. These efficiencies translated directly to the bottom line: the Eastgate's owners saved \$3.5 million on a \$36 million building because an air-

conditioning plant didn't have to be imported. These savings were also passed on to tenants: rents are 20% lower than in a new building next door.

E.

The complex is actually two buildings linked by bridges across a shady, glass-roofed atrium open to the breezes. Fans suck fresh air in from the atrium, blow it upstairs through hollow spaces under the floors and from there into each office through baseboard vents. As it rises and warms, it is drawn out via ceiling vents and finally exits through forty- eight brick chimneys.

F.

To keep the harsh, high yield sun from heating the interior, no more than 25% of the outside is glass, and all the windows are screened by cement arches that just out more than a metre.

G.

During summer's cool nights, big fans flush air through the building seven times an hour to chill the hollow floors. By day, smaller fans blow two changes of air an hour through the building, to circulate the air which has been in contact with the cool floors. For winter days, there are small heaters in the vents.

H.

This is all possible only because Harare is 1600 feet above sea level, has cloudless skies, little humidity and rapid temperature swings days as warm as 31°C commonly drop to 14°C at night. 'You couldn't do this in New York, with its fantastically hot summers and fantastically cold winters,' Pearce said. But then his eyes lit up at the challenge.' Perhaps you could store the summer's heat in water somehow.

I.

The engineering firm of Ove Amp & Partners, which worked with him on the design, monitors daily temperatures outside, under the floors and at knee, desk and ceiling level. Ove Arup's graphs show that the temperature of the building has generally stayed between 23°C and 25°C. with the exception of the annual hot spell just before the summer rains in October, and three days in November, when a janitor accidentally switched off the fans at night. The atrium, which funnels the winds through, can be much

cooler. And the air is fresh far more so than in air-conditioned buildings, where up to 30% of the air is recycled.

J.

Pearce, disdaining smooth glass skins as 'igloos in the Sahara', calls his building, with its exposed girders and pipes, 'spiky'. The design of the entrances is based on the porcupine-quill headdresses of the local Shona tribe. Elevators are designed to look like the mineshaft cages used in Zimbabwe's diamond mines. The shape of the fan covers, and the stone used in their construction, are echoes of Great Zimbabwe, the ruins that give the country its name.

Standing on a roof catwalk, peering down inside at people as small as termites below. Pearce said he hoped plants would grow wild in the atrium and pigeons and bats would move into it. like that termite fungus, further extending the whole 'organic machine' metaphor. The architecture, he says, is a regionalised style that responds to the biosphere, to the ancient traditional stone architecture of Zimbabwe's past, and to local human resources.

Questions 1-5

Choose the correct answer, A, B, C or D.

Write your answers in boxes 1-5 on your answer sheet.

1. Why do termite mounds have a system of vents?

- A. to allow the termites to escape from predators
- B. to enable the termites to produce food
- C. to allow the termites to work efficiently
- D. to enable the termites to survive at night

2. Why was Eastgate cheaper to build than a conventional building?

- A. Very few materials were imported.
- B. Its energy consumption was so low.
- C. Its tenants contributed to the costs.
- D. No air conditioners were needed.

3. Why would a building like Eastgate not work efficiently in New York?

- A. Temperature change occurs seasonally rather than daily.

- B. Pollution affects the storage of heat in the atmosphere.
- C. Summer and winter temperatures are too extreme.
- D. Levels of humidity affect cloud coverage.

4. What does Ove Arup's data suggest about Eastgate's temperature control system?

- A. It allows a relatively wide range of temperatures.
- B. The only problems are due to human error.
- C. It functions well for most of the year.
- D. The temperature in the atrium may fall too low.

5. Pearce believes that his building would be improved by

- A. becoming more of a habitat for wildlife.
- B. even closer links with the history of Zimbabwe.
- C. giving people more space to interact with nature.
- D. better protection from harmful organisms.

Questions 6-10

Complete the sentences below with words taken from Section 1.

Use **NO MORE THAN THREE WORDS** for each answer.

Write your answers in boxes 6-10 on your answer sheet.

- 6. Warm air leaves the offices through.....
- 7. The warm air leaves the building through.....
- 8. Heat from the sun is prevented from reaching the windows by.....
- 9. When the outside temperature drops.....bring air in from outside.
- 10. On cold days... ..raise the temperature in the offices.

Questions 11-13

Answer the question below, using **NO MORE THAN THREE WORDS** from the passage for each answer.

Write your answers in boxes 11-13 on your answer sheet.

Which three parts of the Eastgate Building reflect important features of Zimbabwe's history and culture?

- A. entrances
- B. quill
- C. cages
- D. elevators
- E. fan covers
- F. stone

SECTION 2

Multitasking

A.

Do you read while listening to music? Do you like to watch TV while finishing your homework? People who have these kinds of habits are called multi-taskers. Multitaskers are able to complete two tasks at the same time by dividing their focus. However, Thomas Lehman, a researcher in Psychology, believes people never really do multiple things simultaneously. Maybe a person is reading while listening to music, but in reality, the brain can only focus on one task. Reading the words in a book will cause you to ignore some of the words of the music. When people think they are accomplishing two different tasks efficiently, what they are really doing is dividing their focus. While listening to music, people become less able to focus on their surroundings. For example, we all have experience of times when we talk with friends and they are not responding properly. Maybe they are listening to someone else talk, or maybe they are reading a text on their smart phone and don't hear what you are saying. Lehman called this phenomenon "email voice"

B.

The world has been changed by computers and its spin offs like smart-phones or cellphones. Now that most individuals have a personal device, like a smart-phone or a laptop, they are frequently reading, watching or listening to virtual information. This raises the occurrence of multitasking in our day to day life. Now when you work, you work with your typewriter, your cellphone, and some colleagues who may drop by at any time to speak with you. In professional meetings, when one normally focuses and listens to one another, people are more likely to have a cell phone in their lap, reading or communicating silently with more people than ever, liven inventions such as the cordless phone has increased multitasking. In the old days, a traditional wall phone would ring, and then the housewife would have to stop her activities to answer it. When it rang, the housewife will sit down with her legs up and chat, with no laundry or sweeping or answering the door. In the modern era, our technology is convenient enough to not interrupt our daily tasks.

C.

Earl Miller, an expert at the Massachusetts Institute of Technology, studied the prefrontal cortex, which controls the brain while a person is multitasking. According to his studies, the size of this cortex varies between species, He found that for humans, the size of this

part constitutes one third of the brain, while it is only 4 to 5 percent in dogs, and about 15% in monkeys. Given that this cortex is larger on a human, it allows a human to be more flexible and accurate in his or her multitasking.. However, Miller wanted to look further into whether the cortex was truly processing information about two different tasks simultaneously. He designed an experiment where he presents visual stimulants to his subjects in a way that mimics multi-tasking. Miller then attached sensors to the patients' heads to pick up the electric patterns of the brain. This sensor would show if the brain particles, called neurons, were truly processing two different tasks. What he found is that the brain neurons only lit up in singular areas one at a time, and never simultaneously.

D.

Davis Meyer, a professor of University of Michigan, studied the young adults in a similar experiment. He instructed them to simultaneously do math problems and classify simple words into different categories. For this experiment. Meyer found that when you think you are doing several jobs at the same time, you are actually switching between jobs. Even though the people tried to do the tasks at the same time, and both tasks were eventually accomplished, overall, the task took more time than if the person focused on a single task one at a time.

E.

People sacrifice efficiency when multitasking, Gloria Mark set office workers as his subjects. He found that they were constantly multitasking. He observed that nearly every 11 minutes people at work were disrupted. He found that doing different jobs at the same time may actually save time. However, despite the fact that they are faster, it does not mean they are more efficient. And we are equally likely to self-interrupt as be interrupted by outside sources. He found that in office nearly every 12 minutes an employee would stop and with no reason at all, check a website on their computer, call someone or write an email. If they concentrated for more than 20 minutes, they would feel distressed. He suggested that the average person may suffer from a short concentration span. This short attention span might be natural, but others suggest that new technology may be the problem. With cellphones and computers at our sides at all times, people will never run out of distractions. The format of media, such as advertisements, music, news articles and TV shows are also shortening, so people are used to paying attention to information for a very short time.

F.

So even though focusing on one single task is the most efficient way for our brains to work, it is not practical to use this method in real life. According to human nature, people

feel more comfortable and efficient in environments with a variety of tasks, Edward Hallowell said that people are losing a lot of efficiency in the workplace due to multitasking, outside distractions and self-distractions. As a matter of fact, the changes made to the workplace do not have to be dramatic. No one is suggesting we ban e-mail or make employees focus on only one task. However, certain common workplace tasks, such as group meetings, would be more efficient if we banned cell-phones, a common distraction. A person can also apply these tips to prevent self-distraction. Instead of arriving to your office and checking all of your e-mails for new tasks, a common workplace ritual, a person could dedicate an hour to a single task first thing in the morning. Self-timing is a great way to reduce distraction and efficiently finish tasks one by one, instead of slowing ourselves down with multi-tasking.

QUESTIONS 14-26

Questions 14-18

Reading Passage 2 has six paragraphs, A-F.

Which paragraph contains the following information?

Write the correct letter, A-F, in boxes 14-18 on your answer sheet.

- 14. a reference to a domestic situation that does not require multitasking
- 15. a possible explanation of why we always do multitask together
- 16. a practical solution to multitask in work environment
- 17. relating multitasking to the size of prefrontal cortex
- 18. longer time spent doing two tasks at the same time than one at a time

Questions 19-23

Look at the following statements (Questions 19-23) and the list of scientists below. Match each statement with the correct scientist, A-E.

Write the correct letter, A-E, in boxes 19-23 on your answer sheet.

NB You may use any letter more than once.

List of Scientists

- A. Thomas Lehman
- B. Earl Miller

- C. David Meyer
- D. Gloria Mark
- E. Edward Hallowell

- 19. When faced multiple visual stimulants, one can only concentrate on one of them.
- 20. Doing two things together may be faster but not better.
- 21. People never really do two things together even if you think you do.
- 22. The causes of multitask lie in the environment.
- 23. Even minor changes in the workplace will improve work efficiency.

Questions 24-27

Complete the sentences below.

Choose **NO MORE THAN TWO WORDS** from the passage for each answer.

Write your answers in boxes 24-26 on your answer sheet.

A term used to refer to a situation when you are reading a text and cannot focus on your surroundings is 24 _____

The 25 _____
part of the brain controls multitasking.

The practical solution of multitask in work is to curb ...26.....by not allowing the use of cellphone in 27 _____

SECTION 3

The Pursuit of Happiness

"New research uncovers some anti-intuitive insights into how many people are happy - and why."

A.

Compared with misery, happiness is a relatively unexplored terrain for social scientists. Between 1967 and 1994, 46,380 articles indexed in Psychological Abstracts mentioned depression, 36,851 anxiety, and 5,099 anger. Only 2,389 spoke of happiness, 2,340 life satisfaction, and 405 joy.

B.

Recently we and other researchers have begun a systematic study of happiness. During the past two decades, dozens of investigators throughout the world have asked several hundred thousand Representative sampled people to reflect on their happiness and satisfaction with life or what psychologists call "subjective well-being". In the US the National Opinion Research Center at the University of Chicago has surveyed a representative sample of roughly 1,500 people a year since 1957; the Institute for Social Research at the University of Michigan has carried out similar studies on a less regular basis, as has the Gallup Organization. Government-funded efforts have also probed the moods of European countries.

C.

We have uncovered some surprising findings. People are happier than one might expect, and happiness does not appear to depend significantly on external circumstances. Although viewing life as a tragedy has a long and honorable history, the responses of random samples of people around the world about their happiness paints a much rosier picture. In the University of Chicago surveys, three in 10 Americans say they are very happy, for example. Only one in 10 chooses the most negative description "not too happy". The majority describe themselves as "pretty happy", ...

D.

How can social scientists measure something as hard to pin down as happiness? Most researchers simply ask people to report their feelings of happiness or unhappiness and to assess how satisfying their lives are. Such self-reported well-being is moderately consistent over years of retesting. Furthermore, those who say they are happy and satisfied seem happy to their close friends and family members and to a psychologist-interviewer. Their daily mood ratings reveal more positive emotions, and they smile more than those who call themselves unhappy. Self-reported happiness also predicts other indicators of well-being. Compared with the depressed, happy people are less self-focused, less hostile and abusive, and less susceptible to disease.

E.

We have found that the even distribution of happiness cuts across almost all demographic classifications of age, economic class, race and educational level. In addition, almost all strategies for assessing subjective well-being - including those that sample people's experience by polling them at random times with beepers - turn up similar findings. Interviews with representative samples of people of all ages, for example, reveal that no time of life is notably happier or unhappier. Similarly, men and women are equally likely to declare themselves "very happy" and "satisfied" with life, according to a statistical digest of 146 studies by Marilyn J, Haring, William Stock and Morris A, Okun, all then at Arizona State University.

F.

Wealth is also a poor predictor of happiness. People have not become happier over time as their cultures have become more affluent. Even though Americans earn twice as much in today's dollars as they did in 1957, the proportion of those telling surveyors from the National Opinion Research Center that they are "very happy" has declined from 35 to 29 percent.

G.

Even very rich people - those surveyed among Forbes magazine's 100 wealthiest Americans - are only slightly happier than the average American. Those whose income has increased over a 10-year period are not happier than those whose income is stagnant. Indeed, in most nations the correlation between income and happiness is negligible - only in the poorest countries, such as Bangladesh and India, is income a good measure of emotional well-being.

H.

Are people in rich countries happier, by and large, than people in not so rich countries? It appears in general that they are, but the margin may be slim. In Portugal, for example, only one in 10 people reports being very happy, whereas in the much more prosperous Netherlands the proportion of very happy is four in 10. Yet there are curious reversals in this correlation between national wealth and well-being -the Irish during the 1980s consistently reported greater life satisfaction than the wealthier West Germans. Furthermore, other factors, such as civil rights, literacy and duration of democratic government, all of which also promote reported life satisfaction, tend to go hand in hand with national wealth, As a result, it is impossible to tell whether the happiness of people in wealthier nations is based on money or is a by-product of other felicities.

I.

Although happiness is not easy to predict from material circumstances, it seems consistent for those who have it, In one National Institute on Aging study of 5,000 adults, the happiest people in 1973 were still relatively happy a decade later, despite changes in work, residence and family status.

Questions 28-30

Choose the appropriate letters A-D and write them in boxes 23-30 on your answer sheet.

28 What point are the writers making in the opening paragraph?

- A. Happiness levels have risen since 1967.
- B. Journals take a biased view on happiness.
- C. Happiness is not a well-documented research area
- D. People tend to think about themselves negatively.

29 What do the writers say about their research findings?

- A. They had predicted the results correctly.
- B. They felt people had responded dishonestly.
- C. They conflict with those of other researchers.
- D. Happiness levels are higher than they had believed.

30 In the fourth paragraph, what does the reader learn about the research method used?

- A. It is new.

- B. It appears to be reliable.
- C. It is better than using beepers.
- D. It reveals additional information.

Questions 31-34

According to the passage, which of the findings below (31-34) is quoted by which Investigative Body (A-G)? Write your answers in boxes 31-34 on your answer sheet.

NB There are more Investigative Bodies than findings, so you do not have to use all of them.

- 31. Happiness is not gender related.
- 32. Over fifty percent of people consider themselves to be 'happy'.
- 33. Happiness levels are marginally higher for those in the top income brackets.
- 34. Happy' people remain happy throughout their lives.

Investigative Bodies

- A. The National Opinion Research Center, University of Chicago
- B. Arizona State University
- C. The Institute for Social Research, University of Michigan
- D. Forbes Magazine
- E. The National Institute on Aging
- F. The Gallup Organization
- G. The Government

Questions 35-40

Complete the summary of Reading Passage 20 below. Choose your answers from the box at the bottom of the page and write them in boxes 35-40 on your answer sheet

NB There are more words than spaces so you will not use them all. You may use any of the words more than once.

HOW HAPPY ARE WE?

Example :	Answer
Our happiness levels are by relatively few factors.	Affected

For example, incomes in the States have (35)..... over the past forty years but happiness levels have (36)..... over the same period. In fact, people on average

incomes are only slightly (37)..... happy than extremely rich people and a gradual increase in prosperity makes (38)..... difference to how happy we are. In terms of national wealth, populations of wealthy nations are (39)..... happier than those who live in poorer countries. Although in some cases this trend is (40).....and it appears that other factors need to be considered.

List of words			
Stopped	Slightly	too	great
Doubled	Significant	similar	some
Stabilized	Remarkably	reversed	dropped
No	Less	much	affected
Crept up	Slowed down	more	clearly

Reading Test 6

SECTION 1

Video game research

A. Although video games were first developed for adults, they are no longer exclusively reserved for the grown-ups in the home. In 2006, Rideout and Hamel reported that as many as 29 percent of preschool children (children between two and six years old) in the United States had played console video games, and 18 percent had played hand-held ones. Given young children's insatiable eagerness to learn, coupled with the fact that they are clearly surrounded by these media, we predict that preschoolers will both continue and increasingly begin to adopt video games for personal enjoyment. Although the majority of gaming equipment is still designed for a much older target audience, once a game system enters the household it is potentially available for all family members, including the youngest. Portable systems have done a particularly good job of penetrating the younger market.

B. Research in the video game market is typically done at two stages: some time close to the end of the product cycle, in order to get feedback from consumers, so that a marketing strategy can be developed; and at the very end of the product cycle to 'fix bugs' in the game. While both of those types of research are important, and may be appropriate for dealing with adult consumers, neither of them aids in designing better games, especially when it comes to designing for an audience that may have particular needs, such as preschoolers or senior citizens. Instead, exploratory and formative research has to be undertaken in order to truly understand those audiences, their abilities, their perspective, and their needs.

C. In the spring of 2007, our preschool-game production team at Nickelodeon had a hunch that the Nintendo DS - with its new features, such as the microphone, small size and portability, and its relatively low price point - was a ripe gaming platform for preschoolers. There were a few games on the market at the time which had characters that appealed to the younger set, but our game producers did not think that the game mechanics or design were appropriate for preschoolers. What exactly preschoolers could do with the system, however, was a bit of a mystery. So we set about doing a study to answer the query: What could we expect preschoolers to be capable of in the context of hand-held game play, and how might the child development literature inform us as we proceeded with the creation of a new outlet for this age group? Our context in this case was the United States, although the games that resulted were also released in other regions, due to the broad international reach of the characters. In order to design the best possible DS product for a preschool audience we were fully committed to the ideals

of a 'user-centered approach', which assumes that users will be at least considered, but ideally consulted during the development process. After all, when it comes to introducing a new interactive product to the child market, and particularly such a young age group within it, we believe it is crucial to assess the range of physical and cognitive abilities associated with their specific developmental stage.

D. Revelle and Medoff (2002) review some of the basic reasons why home entertainment systems, computers, and other electronic gaming devices, are often difficult for preschoolers to use. In addition to their still developing motor skills (which make manipulating a controller with small buttons difficult), many of the major stumbling blocks are cognitive. Though preschoolers are learning to think symbolically, and understand that pictures can stand for real-life objects, the vast majority are still unable to read and write. Thus, using text-based menu selections is not viable. Mapping is yet another obstacle since preschoolers may be unable to understand that there is a direct link between how the controller is used and the activities that appear before them on screen. Though this aspect is changing, in traditional mapping systems real life movements do not usually translate into game-based activity.

E. Over the course of our study, we gained many insights into how preschoolers interact with various platforms, including the DS. For instance, all instructions for preschoolers need to be in voice-over, and include visual representations, and this has been one of the most difficult areas for us to negotiate with respect to game design on the DS. Because the game cartridges have very limited memory capacity, particularly in comparison to console or computer games, the ability to capture large amounts of voice-over data via sound files or visual representations of instructions becomes limited. Text instructions take up minimal memory, so they are preferable from a technological perspective. Figuring out ways to maximise sound and graphics files, while retaining the clear visual and verbal cues that we know are critical for our youngest players, is a constant give and take. Another of our findings indicated that preschoolers may use either a stylus, or their fingers, or both although they are not very accurate with either. One of the very interesting aspects of the DS is that the interface, which is designed to respond to stylus interactions, can also effectively be used with the tip of the finger. This is particularly noteworthy in the context of preschoolers for two reasons. Firstly, as they have trouble with fine motor skills and their hand-eye coordination is still in development, they are less exact with their stylus movements; and secondly, their fingers are so small that they mimic the stylus very effectively, and therefore by using their fingers they can often be more accurate in their game interactions.

Questions 1-5

Do the following statements agree with the claims of the writer in Section 1?

Write

YES if the statement agrees with the claims of the writer

NO if the statement contradicts the claims of the writer

NOT GIVEN if it is impossible to say what the writer thinks about this

1. Video game use amongst preschool children is higher in the US than in other countries.
2. The proportion of preschool children using video games is likely to rise.
3. Parents in the US who own gaming equipment generally allow their children to play with it.
4. The type of research which manufacturers usually do is aimed at improving game design.
5. Both old and young games consumers require research which is specifically targeted.

Questions 6-10

Complete the summary using the list of words/phrases, A-I, below.

Preschool children find many electronic games difficult, because neither their motor skills nor their 6 are sufficiently developed.

Certain types of control are hard for these children to manipulate, for example, 7 can be more effective than styluses.

Also, although they already have the ability to relate 8 to real-world objects, preschool children are largely unable to understand the connection between their own 9 and the movements they can see on the screen. Finally, very few preschool children can understand 10

A actions	B buttons	C cognitive skills
D concentration	E fingers	F pictures
G Sounds	H Spoken instructions	I Written menus

Questions 11-13

Choose the correct letter, A, B, C or D

11. In 2007, what conclusion did games producers at Nickelodeon come to?

- A. The preschool market was unlikely to be sufficiently profitable.
- B. One of their hardware products would probably be suitable for preschoolers.

- C. Games produced by rival companies were completely inappropriate for preschoolers.
- D. They should put their ideas for new games for preschoolers into practice.

12. The study carried out by Nickelodeon

- A. was based on children living in various parts of the world.
- B. focused on the kinds of game content which interests preschoolers.
- C. investigated the specific characteristics of the target market.
- D. led to products which appealed mainly to the US consumers.

13. Which problem do the writers highlight concerning games instructions for young children?

- A. Spoken instructions take up a lot of the available memory.
- B. Written instructions have to be expressed very simply.
- C. The children do not follow instructions consistently.
- D. The video images distract attention from the instructions.

14 Which is the best title for Reading Passage 3?

- A. An overview of video games software for the preschool market
- B. Researching and designing video games for preschool children
- C. The effects of video games on the behaviour of young children
- D. Assessing the impact of video games on educational achievement

SECTION 2

Questions 15-20

Section 2 has seven paragraphs, A-G

Choose the correct heading for each paragraph from the list of headings below.

Write the correct number, i-x, in boxes 14-20 on your answer sheet.

List of headings

- i The best moment to migrate
- ii The unexplained rejection of closer feeding ground
- iii The influence of weather on the migration route
- iv Physical characteristics that allow birds to migrate
- v The main reason why birds migrate
- vi The best wintering grounds for birds
- vii Research findings on how birds migrate
- viii Successful migration despite the trouble of wind
- ix Contrast between long-distance migration and short-distance migration
- x Mysterious migration despite lack of teaching

- 15. Paragraph B
- 16. Paragraph C
- 17. Paragraph D
- 18. Paragraph E
- 19. Paragraph F
- 20. Paragraph G

BIRD MIGRATION

A.

Birds have many unique design features that enable them to perform such amazing feats of endurance. They are equipped with lightweight, hollow bones, intricately designed feathers providing both lift and thrust for rapid flight, navigation systems superior to any that man has developed, and an ingenious heat conserving design that, among other

things, concentrates all blood circulation beneath layers of warm, waterproof plumage, leaving them fit to face life in the harshest of climates. Their respiratory systems have to perform efficiently during sustained flights at altitude, so they have a system of extracting oxygen from their lungs that far exceeds that of any other animal. During the later stages of the summer breeding season, when food is plentiful, their bodies are able to accumulate considerable layers of fat, in order to provide sufficient energy for their long migratory flights.

B.

The fundamental reason that birds migrate is to find adequate food during the winter months when it is in short supply. This particularly applies to birds that breed in the temperate and Arctic regions of the Northern Hemisphere, where food is abundant during the short growing season. Many species can tolerate cold temperatures if food is plentiful, but when food is not available they must migrate. However, intriguing questions remain.

C.

One puzzling fact is that many birds journey much further than would be necessary just to find food and good weather. Nobody knows, for instance, why British swallows, which could presumably survive equally well if they spent the winter in equatorial Africa, instead of several thousands of miles further to their preferred winter home in South Africa Cape Province. Another mystery involves the huge migrations performed by arctic terns and mudflat-feeding shorebirds that breed close to Polar Regions. In general, the further north a migrant species breeds, the further south it spends the winter. For arctic terns, this necessitates an annual round trip of 25,000 miles. Yet, en route to their final destination in far-flung southern latitudes, all these individuals overfly other areas of seemingly suitable habitat spanning two hemispheres. While we may not fully understand birds' reasons for going to particular places, we can marvel at their feats.

D.

One of the greatest mysteries is how young birds know how to find the traditional wintering areas without parental guidance. Very few adults migrate with juveniles in tow, and youngsters may even have little or no inkling of their parents' appearance. A familiar example is that of the cuckoo, which lays its eggs in another species' nest and never encounters its young again. It is mind-boggling to consider that, once raised by its host species, the young cuckoo makes its own way to ancestral wintering grounds in the tropics before returning single-handedly to northern Europe the next season to seek out a mate among its own kind. The obvious implication is that it inherits from its parents an

inbuilt route map and direction-finding capability, as well as a mental image of what another cuckoo looks like. Yet nobody has the slightest idea as to how this is possible.

E.

Mounting evidence has confirmed that birds use the positions of the sun and stars to obtain compass directions. They seem also to be able to detect the earth's magnetic field, probably due to having minute crystals of magnetite in the region of their brains. However, true navigation also requires an awareness of position and time, especially when lost. Experiments have shown that after being taken thousands of miles over an unfamiliar landmass, birds are still capable of returning rapidly to nest sites. Such phenomenal powers are the product of computing several sophisticated cues, including an inborn map of the night sky and the pull of the earth's magnetic field. How the birds use their 'instruments' remains unknown, but one thing is clear: they see the world with a superior sensory perception to ours. Most small birds migrate at night and take their direction from the position of the setting sun. However, as well as seeing the sun go down, they also seem to see the plane of polarized light caused by it, which calibrates their compass. Traveling at night provides other benefits. Daytime predators are avoided and the danger of dehydration due to flying for long periods in warm, sunlit skies is reduced. Furthermore, at night the air is generally cool and less turbulent and so conducive to sustained, stable flight.

F.

Nevertheless, all journeys involve considerable risk, and part of the skill in arriving safely is setting off at the right time. This means accurate weather forecasting, and utilizing favorable winds. Birds are adept at both, and, in laboratory tests, some have been shown to detect the minute difference in barometric pressure between the floor and ceiling of a room. Often birds react to weather change before there is any visible sign of them. Lapwings, which feed on grassland, flee west from the Netherlands to the British Isles, France and Spain at the onset of a cold snap. When the ground surface freezes the birds could starve. Yet they return to Holland ahead of a thaw, their arrival linked to a pressure change presaging an improvement in the weather.

G.

In one instance a Welsh Manx shearwater carried to America and released was back in its burrow on Skokholm Island, off the Pembrokeshire coast, one day before a letter announcing its release! Conversely, each autumn a small number of North American birds are blown across the Atlantic by fast-moving westerly tailwinds. Not only do they

arrive safely in Europe, but, based on ringing evidence, some make it back to North America the following spring, after probably spending the winter European migrants in sunny African climates.

Questions 21-22

Choose TWO letters, A-E

Write the correct letters in boxes 21 and 22 on your answer sheet.

Which TWO of the following statements are true of bird migration?

- A. Birds often fly further than they need to.
- B. Birds traveling in family groups are safe.
- C. Birds flying at night need less water.
- D. Birds have much sharper eyesight than humans.
- E. Only shorebirds are resistant to strong winds.

Questions 23-26

Complete the sentences below using NO MORE THAN TWO WORDS from the passage. Write your answers in boxes 23-26 on your answer sheet.

- 23. It is a great mystery that young birds like cuckoos can find their wintering grounds without
- 24. Evidence shows birds can tell directions like a..... by observing the sun and the stars.
- 25. One advantage for birds flying at night is that they can avoid contact with
- 26. Laboratory tests show that birds can detect weather without..... signs.

SECTION 3

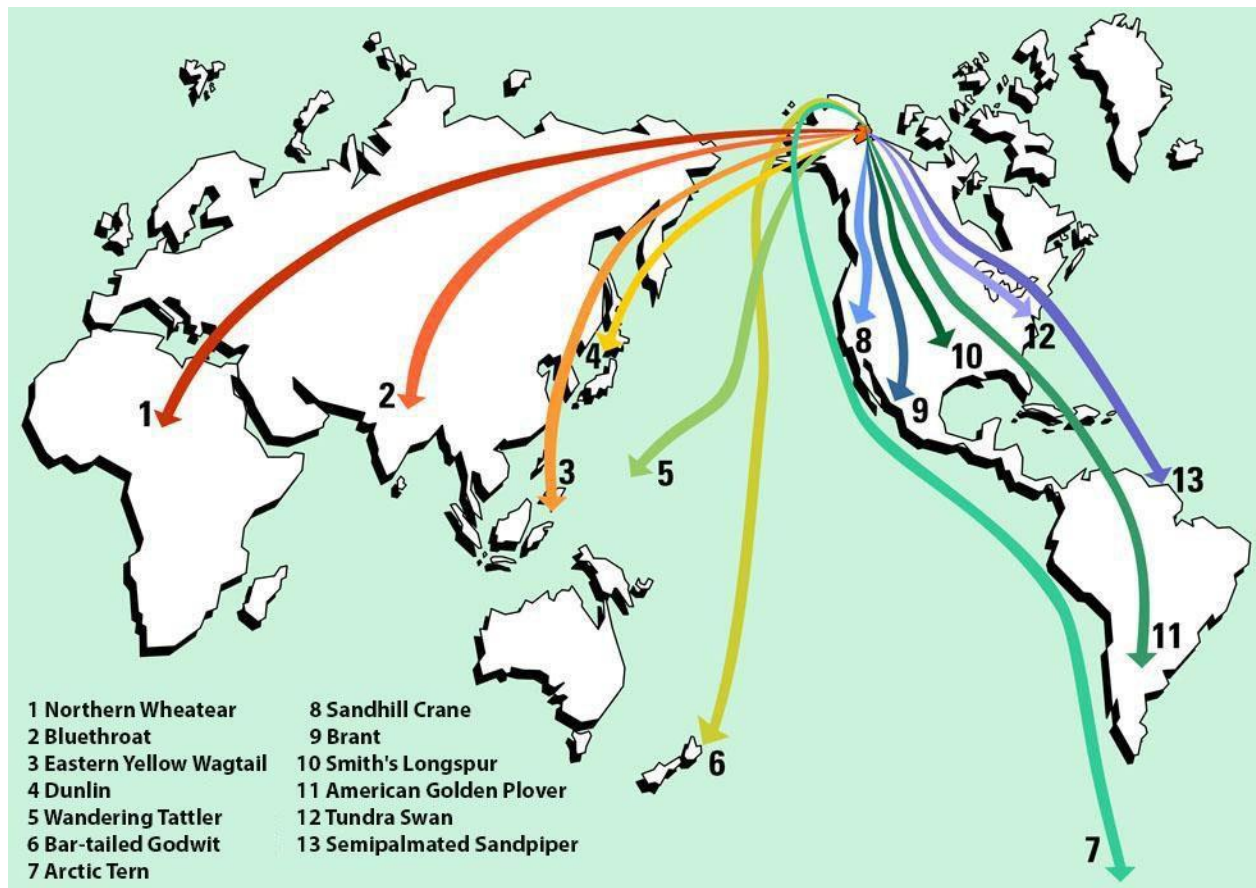

THE HISTORY OF THE TORTOISE

A. If you go back far enough, everything lived in the sea. At various points in evolutionary history, enterprising individuals within many different animal groups moved out onto the land, sometimes even to the most parched deserts, taking their own private seawater with them in blood and cellular fluids. In addition to the reptiles, birds, mammals and insects which we see all around us, other groups that have succeeded out of water include scorpions, snails, crustaceans such as woodlice and land crabs, millipedes and centipedes, spiders and various worms. And we mustn't forget the plants, without whose prior invasion of the land none of the other migrations could have happened.

B. Moving from water to land involved a major redesign of every aspect of life, including breathing and reproduction. Nevertheless, a good number of thoroughgoing land animals later turned around, abandoned their hard-earned terrestrial re-tooling, and returned to the water. Seals have only gone part way back. They show us what the intermediates might have been like, on the way to extreme cases such as whales and dugongs. Whales (including the small whales we call dolphins) and dugongs, with their close cousins the manatees, ceased to be land creatures altogether and reverted to the full marine habits of their remote ancestors. They don't even come ashore to breed. They do, however, still breathe air, having never developed anything equivalent to the gills of their earlier marine incarnation. Turtles went back to the sea a very long time ago and, like all vertebrate returnees to the water, they breathe air. However, they are, in one respect, less fully given back to the water than whales or dugongs, for turtles still lay their eggs on beaches.

C. There is evidence that all modern turtles are descended from a terrestrial ancestor which lived before most of the dinosaurs. There are two key fossils called *Proganochelys quenstedtii* and *Palaeochersis talampayensis* dating from early dinosaur times, which appear to be close to the ancestry of all modern turtles and tortoises. You might wonder how we can tell whether fossil animals lived on land or in water, especially if only fragments are found. Sometimes it's obvious. Ichthyosaurs were reptilian contemporaries of the dinosaurs, with fins and streamlined bodies. The fossils look like dolphins and they surely lived like dolphins, in the water. With turtles it is a little less obvious. One way to tell is by measuring the bones of their forelimbs.

D.

Walter Joyce and Jacques Gauthier, at Yale University, obtained three measurements in these particular bones of 71 species of living turtles and tortoises. They used a kind of triangular graph paper to plot the three measurements against one another. All the land tortoise species formed a tight cluster of points in the upper part of the triangle; all the water turtles cluster in the lower part of the triangular graph. There was no overlap, except when they added some species that spend time both in water and on land. Sure enough, these amphibious species show up on the triangular graph approximately half way between the 'wet cluster' of sea turtles and the 'dry cluster' of land tortoises. The next step was to determine where the fossil fell. The bones of *P. quenstedti* and *P. talampayensis* leave us in no doubt. Their points on the graph are right in the thick of the dry cluster. Both these fossils were dry-land tortoises. They come from the era before our turtles returned to the water.

E. You might think, therefore, that modern land tortoises have probably stayed on land ever since those early terrestrial times, as most mammals did after a few of them went back to the sea. But apparently not. If you draw out the family tree of all modern turtles and tortoises, nearly all the branches are aquatic. Today's land tortoises constitute a

single branch, deeply nested among branches consisting of aquatic turtles. This suggests that modern land tortoises have not stayed on land continuously since the time of *P. quenstedti* and *P. talampayensis*. Rather, their ancestors were among those who went back to the water, and they then re-emerged back onto the land in (relatively) more recent times.

F. Tortoises therefore represent a remarkable double return. In common with all mammals, reptiles and birds, their remote ancestors were marine fish and before that various more or less worm-like creatures stretching back, still in the sea, to the primeval bacteria. Later ancestors lived on land and stayed there for a very large number of generations. Later ancestors still evolved back into the water and became sea turtles. And finally, they returned yet again to the land as tortoises, some of which now live in the driest of deserts.

Questions 27-30

Answer the questions below

Choose **NO MORE THAN TWO WORDS** from the passage for each answer

Write your answers in boxes 27-30 on your answer sheet.

27. What had to transfer from sea to land before any animals could migrate?
28. Which TWO processes are mentioned as those in which animals had to make big changes as they moved onto land?
29. Which physical feature, possessed by their ancestors, do whales lack?
30. Which animals might ichthyosaurs have resembled?

Questions 31-33

Do the following statements agree with the information given in Reading Passage 3?

In boxes 31-33 on your answer sheet, write

TRUE if the statement agrees with the information
FALSE if the statement contradicts the information
NOT GIVEN if there is no information on this more than once.

31. Turtles were among the first group of animals to migrate back to the sea.
32. It is always difficult to determine where an animal lived when its fossilized remains are incomplete.
33. The habitat of ichthyosaurs can be determined by the appearance of their fossilized remains.

Questions 34-39

Complete the flow-chart below

Choose **NO MORE THAN TWO WORDS AND/OR A NUMBER** from the passage for each answer.

Write your answers in boxes 34-39 on your answer sheet.

Method of determining where the ancestors of turtles and tortoises come from

Step 1: 71 species of living turtles and tortoises were examined and a total of 34were taken from the bones of their forelimbs.

Step 2: The data was recorded on a 35 (necessary for comparing the information). Outcome: Land tortoises were represented by a dense 36of points towards the top. Sea turtles were grouped together in the bottom part.

Step 3: The same data was collected from some living 37 species and added to the other results. Outcome: The points for these species turned out to be positioned about 38..... up the triangle between the land tortoises and the sea turtles.

Step 4: Bones of *R quenstedti* and *P tampanensis* were examined in a similar way and the results added.

Outcome: The position of the points indicated that both these ancient creatures were 39.....

Questions 40

Choose the correct letter A, B, C or D.

Write the correct letter in box 40 on your answer sheet.

According to the writer, the most significant thing about tortoises is that

- A. they are able to adapt to life in extremely dry environments.
- B. their original life form was a kind of primeval bacteria,
- C. they have so much in common with sea turtles.
- D. they have made the transition from sea to land more than once.

Reading Test 17

SECTION 1

You should spend about 20 minutes on Questions 1-13 which are based on Reading Passage 1 below.

Questions 1-5

Reading Passage 1 has 9 paragraphs A-I.

From the List of headings below choose the 5 most suitable headings for paragraphs B, C, D, E and F. Write the appropriate numbers (i-x). NB There are more headings than paragraphs, so you will not use them all.

List of Headings

- i. A convenient and cost-effective solution
- ii. Encouraging audience participation
- iii. The backup technology
- iv. Tailoring the service
- v. Success brought by interactive software
- vi. The features of the new platform
- vii. Synchronization and connectivity
- viii. The application server
- ix. The Mobile Interactive TV Platform
- x. Different market segmentation

1. Paragraph B
2. Paragraph C
3. Paragraph D
4. Paragraph E
5. Paragraph F

TV

A.

Interactive production company Two Way TV has been commissioned by ITV Play to create a unique new programming strand, Play DJ. Play DJ features a number of Play-

along SMS games, produced using Two Way TV's unique Simcast text-to-TV platform. William van Rest, Controller of ITV Play, said: "Play DJ is a little bit different from the traditional quiz TV formats, contributing to our aim of moving the sector on. It has a unique blend of entertainment and game play which we hope will build up a loyal following".

B.

Broadcasters, programme-makers and TV networks now have the widest ever range of interactive TV and mobile to TV products and services available. With interactive software solutions, TV networks like ITV and BBC Channel 4 have succeeded in designing and building many of flagship services including Pop Idol, The Premiership and Big Brother. More recently, Two Way TV helped ITV go interactive on cable TV for the first time with X Factor and This Morning.

C.

The sudden surge in the number of interactive TV platforms clearly demonstrates that viewers are enjoying participating in voting, quizzes and other interactive activities using their mobile phones. The "getting the audience involved" experience lets viewers interact with one another or with content associated with reality shows, regular shows, or advertisements by sending in messages that are displayed or accumulated on the television screen. They can answer questions, cast votes or predict what's about to happen on screen. The voting and response services utilize the mobile phone of the TV viewer to interactively and directly participate in what's happening on TV—simply by sending his vote or SMS message to a premium number during the broadcast of the TV programme. The solution can analyze up to 6,000 SMS per second and provides an easy-to-use web-based administration tool to track and manage the SMS and MMS traffic. It also generates graphical results that bring value to the show and act as a compulsive element for audience participation.

D.

The primary technological underpinnings of the new platform are an application server, located in the service provider's computer center, and a broadcasting system installed at the broadcaster's central control station. The application server provides web-based tools for the moderation and selection of SMS and MMS messages, and its graphical user interface (GUI) enables screen design and control of the programme. In addition, the server provides all the interface connections with SMS and MMS gateways, as well as with mobile operators' billing systems. The broadcasting system, meanwhile, creates the video signals for TV broadcast, and offers interfaces with programme planning tools, video servers, and text and graphics generators.

E.

Whereas the market was previously characterized by closed, proprietary platforms that offered broadcasters only one limited alternative and necessitated using different platforms for different applications, the new platform, differentiated in the marketplace by its open and modular approach, enables numerous applications, and provides interfaces for the seamless integration of games and TV formats from third-party providers. The differences between mobile interactive TV platform and other technologies in the market add up to this; fast and easy creation, delivery, integration, and management of rich media interactive TV applications into live or prerecorded programs. The Mobile Interactive TV Platform allows broadcasters to integrate interactive services into their TV programme. Broadcasters merely have to select the desired services from the platform. Applications, like SMS2TV, MMS2TV, games, chats or votings, can be used in any combination. The production phase of interactive TV applications should not require costly programming and specialist technical knowledge. The TV programme can be arranged individually by means of a userfriendly graphical user interface. A suite of software and hardware is available that delivers multimode applications for broadcasters and other application service providers.

F.

The mobile platform offers convenience and a cost-effective solution to the broadcaster, while putting great emphasis on reliability. Its key features include a provisioning

environment, synchronization of diverse media while supporting mass interactions by many viewers supporting mass interactions by many viewers to the same TV application in a real-time mode, enabling the easy creation of TV applications, the production of very low-cost TV applications, and a high degree of connectivity to external interfaces. These features are ideal for media owners who want to reach users regardless of their public network provider. They give a fast and reliable platform for processing high volume traffic, seamless connections to communication networks and to the broadcast control room, an "invisible" dynamic and flexible billing system and an interactive "back channel" (an immediate, "always-on" channel through which users can respond or receive messages in any format: SMS, MMS, ringtones, icons, etc.).

G.

This is a real end-to-end solution tying all the knots needed to create a show that gather information from a magnitude of diverse media, while handling aspects of accounting, connecting to all kinds of cellular networks, supplying scalable and robust configurations, and referring to third parties for purposes of playing for real money, raising donations, and even selling services and products.

H.

For these reasons texting and other user interactions in response to television fl I programming or to influence television programming have gained a lot of popularity lately. Next-generation television services that focus on interactivity are most likely to find success in Spain, the UK and Japan, with the US ranking sixth in a study that examines the digital readiness of 12 countries for interactive and personalized television services. In Spain, nearly 80% of those surveyed showed an interest in at least one key advanced television offering, especially those related to interactive features such as personalized recommendations and voting. In both the UK and Japan, 75% showed an inclination towards interactive services.

I.

"Different populations have quite unique reactions to an interest in applications regarding advanced TV services," said Deepa Iyer, research analyst at Parks Associates. "Consumers in the United Kingdom are more inclined toward interactive features such as voting abilities whereas the Japanese prefer features such as personalized recommendations and one-button access capabilities. "The 'one size fits all' mind-set regarding television services is obsolete," Iyer said. "The challenge is to meet the broadcaster's needs quickly, limiting the amount of time required to make a broadcast-quality product and to allow all the viewers to participate."

Questions 6-9

Matching the following descriptions as referring to

- A. SMS
- B. GUI
- C. Back Channel
- D. The Application Server
- E. The Mobile Interactive TV Platform

- 6. It provides a passage through which users receive and send messages.
- 7. It enables screen design and control of the programme.
- 8. It provides web-based tools to select messages.
- 9. It enables broadcasters to combine interactive services with their TV programmes.

Questions 10-13

Do the following statements agree with the information given in Reading Passage 1?

In boxes 10-13 on your answer sheet write

TRUE, if the statement is true

FALSE, if the statement is false

NOT GIVEN, if the information is not given in the passage.

- 10. The Japanese market calls for more promotional messaging.
- 11. The United States was among the first countries to implement Two Way TV
- 12. Texting is just one form of user interface

13. UK consumers prefer conventional TV, as they are a more passive audience

SECTION 2

You should spend about 20 minutes on Questions 14 — 27 which are based on Reading Passage 2 below.

SPELLING SYSTEM REFORM

A.

Our children are being beaten up by a crazy spelling system that appears to be loved by millions. They are being beaten up because they are constantly bombarded by unpredictable silent letters, double consonants that defy explanation, endless varieties of vowel combinations, and rules that are notoriously unreliable. They are forced to attempt to learn a system that is illogical, inconsistent, and — system that is illogical, inconsistent, and — worst of all — needlessly complicated. Not only are they physically beaten up. but many of them do end up with well-concealed scars on their psyches. At least one study has shown that using a system as irrational as ours may arrest the development of logical thinking. That's not just being beating up; it's child abuse exactly.

B.

There's a social stigma attached to being a poor speller, although the only thing being a good speller makes one better at is spelling. It doesn't make one a better writer, a better poet, a more creative person with words. it doesn't make him understand the essence of the language better. Shakespeare would have been the exact same creative genius he was whether he was a good or bad speller. He was just lucky enough to have lived in a day when he was judged by the meaning of his words, rather than the placement of the letters within those words. In Shakespeare's day, most people's spelling was erratic; therefore, when he spelled words many different ways no one even noticed.

C.

During the last 30 years or so, literacy in the English-speaking world has been declining at an alarming rate. It's not hard to guess why. During the rapid development of electronics in the past 40 years speech for the first time in the entire years, speech, for the first time in the entire course of history, has become a mass medium. The people, having discovered those electronic channels through which they can receive Information in their own language, are now circumventing the outdated writing system which has been the bottleneck in mass communication. And having alienated themselves from it, they have become less able and less willing to cope with its irrational complexities. In an attempt to correct this situation, the Federal Government of the United States initiated its "Decade of the '70's" program. During that ten-year period, both State and Federal governments have poured massive sums into programs designed to eradicate illiteracy not by re designing the outdated writing system, but by attempting to shape the minds of human beings into conformity with the system. This extravagant program achieved nothing. The drift to illiteracy continues as before, except that it now has reached the proportions of a crisis. For example, the United States Navy now complains that from 40% to 50% of today's recruits can't read the instruction manuals. The Navy is plainly worried about the future. And they are not alone.

D.

The problem in the English-speaking world is that the writing system has been shaped a bit, here and there. In the direction of Modern English, but the fact is that its spelling is based primarily on another language. Middle English, which hasn't been spoken in at least 400 years, and is no longer understood. From the point of view of a technician, this problem is easily solved. All one needs to do is to design a writing system specifically for Modern English, so that all three elements in the chain of communication can function in harmony. The proposal is that we systematically and definitively wipe out all the anomalous spellings in English so that anyone looking at a word in print will immediately know how to pronounce it — and, conversely, anyone attempting to write English will be able to get every single spelling right the first time. In other words, proponents of English spelling reform want us to adopt a mostly phonetic orthography. Indeed, a certain amount of reform has happened all by itself over the years, as previously alternative spellings

have worked their way into the dictionary as standard forms. Think of the word "catalog" , which was formerly spelled "catalogue" , or "draft" , formerly spelled "draught".

E.

On a relatively small scale, sensible spellings do sometimes replace less sensible ones. But the design of a new writing system is only a partial solution. The major obstacle that confronts the orthographic reformer is the existing system itself, which, with all its scandalous lack of utility, happens to be an Investiture that seems to defy displacement. The first question that arises is how far such a reform would go. We could make a good start by simply removing letters that are never pronounced. Though could become tho, guard could become gard, foreign could become forin, doubt could become dout, Christmas could become Chrismas, and so on. We could also, perhaps, reduce the number of ways to write any particular sound — so the “ee” sound in street, for example, might always be written "ee" , never "ea " , " ie" , "ei" , "i" , "e", or whatever. Although these changes would help, however, they would save only a subset of the problems — and the more extensive the changes are, the more difficult they would be for the public to accept.

F.

Since we've already programmed our brains to work under the current, flawed system simplified spellings would be at least initially — much harder for all the hundreds of millions of English readers to read. There's also that little matter of what to do with the billions of books, magazines, web sites, and other documents that already use the "old" spelling. Then there are those who point out that a word's spelling gives important clues to its etymology, meaning, and relationship to other words. So even though the “a” in the word real is not pronounced, It serves the important function of showing the word's connection to the word " reality" , in which the " a " is pronounced. Lose that letter, and the words no longer appear to have anything to do with each other. Thus, at least some of the peculiarities of English spelling exist for entirely legitimate, and still useful, historical reasons.

G.

Sir Winston Churchill opposed a spelling reform bill in British parliament in 1949. He felt that changing the appearance of words would "mess up the language of Shakespeare" If Mr. Churchill had understood the detrimental effect that needlessly complex spelling has on literacy, he would have realized that unreformed spelling ruins the language of Shakespeare because it prevents an extra 10% of the population from being literate enough to read t. That may be too high a price to pay.

Questions 14 — 20

Do the following statements agree with the information given in Reading Passage 2?

In boxes 14-20 on your answer sheet write

TRUE, if the statement is true

FALSE, if the statement is false

NOT GIVEN, if the information is not given in the passage.

14. The presence of unpronounced letters sometimes serves to connect meanings of words.
15. Some people already used new spelling systems to write books and magazines.
16. The problem lies not with the system of spelling but with the method of teaching.
17. Simplified spelling would not be immediately successful because we have grown accustomed to the flawed system.
18. The current spelling system may hinder children from developing logical thinking
19. The program initiated by the Federal Government aimed at eliminating illiteracy.
20. Shakespeare was both a good writer and speller

Questions 21-23

Complete the sentences below USING **NO MORE THAN THREE WORDS** taken from the passage.

21. Spelling reform is based on an essentially _____ orthography
22. The spelling system we use today has a _____ effect on people's literacy.
23. Churchill feared that a spelling reform bill would _____ the language of Shakespeare.

Questions 24-27

Match the following statements with their example word.

- A. self-change over time
- B. limited way to write
- C. unpronounced letter
- D. unpronounced letter works

- 24. real
- 25. Christmas
- 26. catalogue
- 27. street

SECTION 3

You should spend about 20 minutes on Questions 28-40, which are based on Reading Passage 3 below.

PERFUME

A.

Perfume comes from the Latin "per" meaning "through" and "fumum", or "smoke". Many ancient perfumes were made by extracting natural oils from plants through pressing and steaming. The oil was then burned to scent the air. Since the beginning of recorded history, humans have attempted to mask or enhance their own odor by using perfume, which emulates nature's pleasant smells. Many natural and man-made materials have been used to make perfume to apply to the skin and clothing, to put in cleaners and cosmetics, or to scent the air. Because of differences in body chemistry, temperature, and body odors, no perfume will smell exactly the same on any two people.

B.

Before perfumes can be composed, the odorants used in various perfume compositions must first be obtained. Synthetic odorants are produced through organic synthesis and purified. Odorants from natural sources require the use of various methods to extract the aromatics from the raw materials. Enfleurage is a process from the raw materials. Enfleurage, a process that uses odorless fats that are solid at room temperature to capture the fragrant compounds exuded by plants, is the oldest of fragrance extraction techniques. The process can be "cold" enfleurage or "hot" enfleurage. In cold enfleurage, a large framed plate of glass, called a chassis, is smeared with a layer of animal fat, usually from pork or beef, and allowed to set. Botanical matter, usually petals or whole flowers, is then placed on the fat and its scent is allowed to diffuse into the fat over the course of 13 days. The process is then repeated by replacing the spent botanicals with fresh ones until the fat has reached a desired degree of fragrance saturation.

C.

In hot enfleurage, solid fats are heated and botanical matter is stirred into the fat. Spent botanicals are repeatedly strained from the fat and replaced with fresh material until the fat is saturated with fragrance. In both instances, the fragrance-saturated fat is now called the "enfleurage pomade". The enfleurage pomade is washed or soaked in ethyl alcohol to draw the fragrant molecules into the alcohol. The alcohol is then separated from the fat and allowed to evaporate, leaving behind the essential oil of the botanical matter. The spent fat is usually used to make soaps since it is still relatively fragrant. This method of fragrance extraction is by far one of the oldest. It is also highly inefficient and costly but was the sole method of extracting the fragrant compounds in delicate floral botanical such as jasmine and tuberose, which would be destroyed or denatured by the high temperatures required by methods of fragrance extraction such as steam distillation. The method is now superseded by more efficient techniques such as solvent extraction or supercritical fluid extraction using liquid carbon dioxide (CO₂) or similar compressed gases.

D.

The results of the extraction are either essential oils, absolutes, concretes, or butters, depending on the amount of waxes in the extracted product. All these techniques will to a certain extent, distort the odour of the aromatic compounds obtained from the raw materials. This is due to the use of heat, harsh solvents, or through exposure to oxygen in the extraction process which will denature the aromatic compounds, which either change their odour character or renders them odourless. The country-island Madagascar—known for its extremely unique biodiversity—is recognized as holding tremendous potential for the development of new products in the essential oils, cosmetic and body care, due to the fact that 80% of its flora and fauna is endemic—meaning so unique that they are found nowhere else in the world.

E.

For 85 million years, the flora and fauna of Madagascar evolved in isolation from the rest of the world. Examples of the totally unique essential oils and botanicals from Madagascar include the Ravinsara leaf known for its aroma, spice and therapeutic

applications. Aromatherapists believe that the oil can travel deep into muscle tissues and joints. Some have suggested that the oil has antiviral properties, and it is thought to relieve rheumatism and joint inflammation. Another totally unique essential oil from Madagascar to relieve rheumatic pains is Katrafay, which is also used in Madagascar by women after giving birth as a fortifier and tonic. It is also believed to have anti-inflammatory properties. *Cinnamosma fragrans* is used traditionally as a decoction for treatment of malarial symptoms. The essential oil is used for tired and aching muscles.

F.

According to suppliers, there are quite a few other high quality aromatherapy oils produced in Madagascar. These include niaouli used for clearing, cleansing and mental stimulation; *lantana camara* used for flu, colds, coughs, fevers, yellow fever, dysentery and jaundice; ylang-ylang used as an aphrodisiac; cinnamon (bark and leaf) used to destroy microbes and bacteria, and holding promise for people with diabetes; tamanu (*Calophyllum inophyllum*) used to treat skin ailments; wild orange petit grains, used as a lively and soothing fragrance and to relieve dry skin; a unique ginger (fresh) oil used for circulation, aching muscles and nausea; and clove bud oil, which has been utilized as a local anesthetic in dentistry, as a food preservative and as an alternative to Deet.

G.

Because perfumes and essential oils depend heavily on harvests of plant substances and the availability of animal products, perfumery can often turn risky. Thousands of flowers are needed to obtain just one pound of essential oils, and if the season's crop is destroyed by disease or adverse weather, perfumeries could be in jeopardy. In addition, consistency is hard to maintain in natural oils. The same species of plant raised in several different areas with slightly different growing conditions may not yield oils with exactly the same scent. Problems are also encountered in collecting natural animal oils. Many animals once killed for the value of their oils are on the endangered species list and now cannot be hunted. For example, sperm whale products like ambergris have been outlawed since 1977. Also, most animal oils in general are difficult and expensive to extract. Deer musk must come from deer found in Tibet; civet cats, bred in Ethiopia, are

kept for their fatty gland secretions; beavers from Canada and the former Soviet Union are harvested for their castor. Synthetic perfumes have allowed perfumers more freedom and stability in their craft, even though natural ingredients are considered more desirable in the very finest perfumes. The use of synthetic perfumes and oils eliminates the need to extract oils from animals and removes the risk of a bad plant harvest, saving much expense and the lives of many animals.

Questions 28-30

The flowchart below demonstrates the cold enfleurage method of fragrance extraction.

Complete the flowchart with NO MORE THAN THREE WORDS for each blank from the passage.

Questions 31-34

Do the following statements agree with the information given in Reading Passage 3?

In boxes 31-34 on your answer sheet write;

- TRUE, if the statement is true
- FALSE, if the statement is false
- NOT GIVEN, if the information is not given in the passage.

- 31. Synthetic perfumes outweigh natural counterparts in all aspects.
- 32. The fragrance of jasmine can be extracted by employing the method of steam distillation.
- 33. Nowadays, the biggest industry of Madagascar is perfumery.
- 34. The original Latin meaning of perfume is the scent smoke.

Questions 35-39

Use the information in the passage to match the essential oils listed (A — F) with their purposes.

Write the appropriate letter (A— F) in boxes 34- 39 on your answer sheet.

- A. Katralay
- B. Clove bud oil
- C. Ylang-ylang
- D. Cinnamon
- E. Lantana caniara
- F. Ginger oil

- 35. used as postpartum tonic
- 36. used as medicine for influenza
- 37. used as medicine for diabetes
- 38. used as medicine for nausea
- 39. used as anesthetic medicine

Question 40

List three kinds of protected animals whose oils are highly valued. Write **NO MORE THAN THREE WORDS** for each blank.

Reading Test 18

SECTION 1

You should spend about 20 minutes on Questions, which are based on Reading Passage 1 below.

COASTLINE DANGER

A.

On July 1, 1998, an unexpected tsunami pounded the northern coastline of Papua New Guinea. In three massive waves, as high as 15 meters, it washed away entire villages, drowned over 2500 people and left thousands homeless. Survivors of the Papua New Guinea disaster described the tsunami as a wall of water hurling toward shore, averaging 10 meters high and extending about 5 kilometres from front to back. The largest wave swept over the shore at speeds of up to 20 kilometres per hour for more than a minute, before draining away in preparation for the next.

B.

What are tsunamis? Tsunamis are enormous waves initiated by sudden seismic events. A tsunami is generated when a large mass of water is displaced suddenly, creating a swell that moves away from its origin. The effect is similar to the ripples that form when a pebble is dropped into a pond-but a thousand times larger. A tsunami wave can be 100 to 200 kilometres wide and long. It can reach speeds of 725 to 800 km/hour. It can travel thousands of kilometres across the ocean and maintain a barely not likeable height of less than a half meter. However, as the tsunami enters the shallow waters of a coastline, it bunches up into a monstrous wall of seawater that can reach heights of 30 meters and still be many kilometres in length.

C.

The impact of such large waves on a shoreline can be devastating. Buildings, bridges, and can be devastating. Buildings, bridges, and other structures may be destroyed. Extensive beach erosion commonly occurs. In addition, water may flood areas hundreds

of meters inland. The amount of damage depends on the geometry of the coastline as well as the size of the tsunami. Because variations in the shapes of coastal areas can focus or diffuse the energy in a wave, different parts of a coastline may experience very different degrees of damage from a given tsunami. The largest waves, hence the greatest amount of damage, are generally observed in embayment that funnel the waves into a narrow bay.

D.

Tsunamis are frequently caused by underwater earthquakes with a magnitude greater than 7 on the Richter scale. The most dangerous tsunamis are triggered by quakes with a shallow focus that produce extended vibrations and shift the seafloor vertically. Tsunamis are sometimes generated by other catastrophic events, such as underwater volcanic explosions. For example, the disastrous eruption of Krakatau that killed more than 30,000 people in 1883 produced waves that were 35 meters high and that travelled thousands of kilometres. Although scientists are not certain exactly how this eruption led to a tsunami, a recent study of sea-floor deposits suggests that water displaced by immense ash flows was the cause. Underwater landslides have also been known to create tsunamis. For instance, the Hawaiian Islands have all experienced enormous landslides in the past, and coastal sediments record evidence of tsunamis that were generated from them.

E.

The exact trigger of the Papua New Guinea tsunami is not yet known, although an earthquake was certainly involved. Because the earthquake was relatively small, scientists were somewhat surprised by the disastrous results. One study of seismic data indicated that the earthquake was centred offshore and produced a 2-meter vertical displacement of the seafloor; the conclusion was that this abrupt motion triggered the tsunami. Other evidence indicates that the tsunami was produced by a huge offshore landslide, itself triggered by the earthquake. Eyewitness accounts indicate that the first wave struck shore about 20 minutes after the mainshock of the earthquake, too long for the tsunami to have originated from sub-sea faulting during the quake. A slump or landslide typically lags several minutes behind an earthquake and could explain the

delay. Further support comes from a 70-seconds long rumble recorded in the middle of the Pacific soon after the earthquake. This sound lasted too long to have come from a small aftershock and may have represented a seafloor slide.

F.

Unfortunately, tsunamis cannot be stopped or prevented. However, effective warning systems might save hundreds of lives. In the United States, the National Tsunami Hazard Mitigation Program has been developed to reduce the impacts of tsunamis along the U.S. Pacific Coast. One goal of this program is to improve the tsunami warning systems. Components of such systems include seismic sensors that warn of large earthquakes and oceanic sensors that detect tsunamis crossing the ocean. Destructive tsunamis need to be detected quickly so that warnings can be issued to allow the orderly evacuation of coastal communities in the path of the waves. Of course, evacuation can only save lives if the tsunami is triggered far enough away to give advanced warning.

Questions 1-4

Reading Passage 1 has six paragraphs, labelled A-F.

Answer questions and write the appropriate letter; A-F, in boxes on your answer sheet.

1. Which paragraph explains the measures that have been taken to reduce the impact of tsunamis along the U.S. Pacific coast?
2. Which paragraph discusses the probable cause of the Papua New Guinea tsunami?

Write the name and the year in the box on your answer sheet.

3. On what island and in what year was a tsunami triggered by a volcanic eruption that killed 30,000 people?

Using **NO MORE THAN THREE WORDS**, write your answer in the box on your answer sheet.

4. Tsunamis are frequently caused by underwater earthquakes with a magnitude greater than 7, as indicated on what scale?

Questions 5-6

Complete the summary below about the tsunami that hit Papua New Guinea. Choose **NO MORE THAN TWO WORDS** from the passage for each answer:

On July 1, 1998, an unexpected tsunami ___5___ the northern coast of Papua New Guinea. In three massive waves, as high as 15 meters, it ___6___ entire villages, drowned over 2500 and left thousands homeless. Survivors of the Papua New Guinea disaster described the tsunami as a wall of water ___7___ shore, averaging 10 meters high and extending about 5 kilometres from front to back. The largest wave ___8___ the shore at speeds of up to 20 kilometres per hour for more than a minute, before draining away in preparation for the next.

Questions 9-10

Complete the table below which describes the power of a tsunami. Using **NO MORE THAN THREE WORDS**.

<u>Physical Characteristic</u>	<u>Measurement</u>
Example The width and length of a tsunami can be ____	Answer 100 - 200 kilometers
It can reach speeds of ____	___ 9 ___ kilometers/hour
It can cover vast distances equal to ____	___ 10 ___

Question 11

Choose the appropriate letter, A-D, and write it on your answer sheet.

11. According to the text, tsunamis generally cause the greatest amount of observable damage ____

- A. in unpaved areas.
- B. in wide and flat areas.
- C. in embayments.
- D. in sandy beach areas.

SECTION 2

You should spend about 20 minutes on Questions 12-25 which are based on Reading Passage 2.

MEASURING HUMAN BEHAVIOUR

A. Psychological Testing is the measurement of some aspect of human behavior by procedures consisting of carefully prescribed content, methods of administration, and interpretation. The test may address any aspect of intellectual or emotional functioning, including personality traits, attitudes, intelligence, or emotional concerns. Interpretation is based on a comparison of the individual's responses with those previously obtained to establish appropriate standards for the test scores. The usefulness of psychological tests depends on their accuracy in predicting behavior. By providing information about the probability person's responses or performance, tests aid making a variety of decisions.

B. The primary drive behind the development of the major tests used today was the need for practical guidelines for solving social problems. The first useful intelligence test was prepared in 1905 by the French psychologists Alfred Binet and Theodore Simon. The two developed a 30- item scale to ensure that no child could be denied instruction in the Paris school system without formal examination. In 1916, the American psychologist Lewis Terman produced the first Stanford Revision of the Binet-Simon scale to provide comparison standards for Americans from age three to adulthood. The test was further revised in 1937 and 1960, and today the Stanford Binet remains one of the most widely used intelligence tests.

C. The need to classify soldiers during World War I resulted in the development of two group intelligence tests - Army Alpha and Army Beta. To help detect soldiers who might break down in combat, the American psychologist Robert Woodworth designed the Personal Data Sheet, a forerunner of the modern personality inventory. During the 1930s controversies over the nature of intelligence led to the development of the Wechsler-Bellevue Intelligence Scale, which not only provided an index of general mental ability

but also revealed patterns of intellectual strengths and weaknesses. The Wechsler tests now extend from the preschool through the adult age range and are at least as prominent as the Stanford-Binet.

D. As interest in the newly emerging field of psychoanalysis grew in the 1930s, two important projective techniques introduced systematic ways to study unconscious motivation: the Rorschach or Inkblot test developed by the Swiss psychiatrist Hermann Rorschach-using a series of inkblots on cards, and a story-telling procedure called the Thematic Apperception Test developed by the American psychologists Henry A. Murray and C. D. Morgan. Both of these tests are frequently included in contemporary personality assessment.

E. In educational settings, intelligence and achievement tests are administered routinely to assess individual accomplishment and to improve instruction and curriculum planning. Elementary schools use kindergarten and first grade screening procedures to determine readiness for reading and writing programs. Screening tests also identify developmental, visual, and auditory problems for which the child may need special assistance. If the child's progress in school is unusually slow, or if he or she shows signs of a learning disability or behavior disorder, testing may clarify whether the difficulty is neurologically or emotionally based. Many high schools administer interest inventories and aptitude tests to assist in the students' educational or vocational planning.

F. In clinics or hospitals, psychological tests may be administered for purposes of diagnosis and treatment planning. Clinical tests can provide information about overall personality functioning and the need for psychotherapy; testing also may focus on some specific question, such as the presence or absence of organically based brain disorder. Clinical testing usually involves a battery of tests, interpreted as a whole, to describe intellectual and emotional states. Decisions about treatment do not depend exclusively on psychological test results but are based on the judgment of relevant staff members with whom the psychologist collaborates.

G. Tests are also used in industrial and organizational settings, primarily for selection and classification. Selection procedures provide guidelines for accepting or rejecting candidates for jobs. Classification procedures, which are more complex, aim to specify the types of positions for which an individual seems best suited. Intelligence testing is usually supplemented by methods devised expressly to meet the needs of the organization.

H. The major psychological testing controversies stem from two interrelated issues: technical shortcomings in test design and ethical problems in interpretation and application of results. Some technical weaknesses exist in all tests. Because of this, it is crucial that results be viewed as only one kind of information about any individual.

Questions 12-16

Reading Passage 2 has eight paragraphs, A-H. Choose the most suitable headings for paragraphs B, D and F-H from the list of headings below. Write the appropriate number i-x, in boxes on your answer sheet.

NB: There are more headings than paragraphs, so you will not use them all.

List of Headings

- i Present Criticisms of Testing
- ii What is Psychological Testing?
- iii Obtaining Information for Clinical Purposes
- iv Inkblots and Story-telling
- v The First Intelligence Test
- vi Employment Testing
- vii Expansion during WWII
- viii Current Accord on the Validity of Testing
- ix Utilization in Academic Settings
- x Progress Sparked by WWI

Example Answer

Paragraph C x

- 12. Paragraph B
- 13. Paragraph D
- 14. Paragraph F
- 15. Paragraph G
- 16. Paragraph H

Questions 17-22

Do the following statements agree with the views of the writer in Reading Passage 2?

In boxes 17-22 on your answer sheet, write

YES, if the statement agrees with the writer

NO, if the statement does not agree with the writer

NOT GIVEN, if there is no information about this in the passage

17. The first useful intelligence test was prepared in 1905 by Alfred Binet and Theodore Simon.

18. The Stanford-Binet intelligence test is comprised of multiple-choice questions

19. During WW I, psychologist Robert Woodworth designed the Personal Data Sheet to help detect soldiers who had an especially high level of intelligence.

20. The Wechsler tests are not nearly as prominent as the Stanford-Binet tests

21. Swiss psychiatrist Hermann Rorschach invented a story-telling procedure called the Thematic Apperception Test.

22. Most criticisms of testing arise from the over-valuation of and inappropriate reliance on test results in making major life decisions, especially in the case of intelligence testing.

Questions 23-25

Complete the notes below with words taken from Reading Passage 2.

Use **NO MORE THAN ONE OR TWO WORDS** for each answer.

Write your answers in boxes 23-25 on your answer sheet.

Present-day uses of Psychological Testing

- i. Educational settings

- A. to assess individual accomplishment
- B. to improve instruction and ___23___
- C. to identify individual learning problems and their causes
- D. to assist students with educational or vocational planning

ii. Clinics or hospitals

- A. to assist with ___24___ and treatment planning
- B. to assess overall personality functioning
- C. to detect organic brain disorders

iii. Industrial and organizational settings

- A. to determine the acceptance or rejection of job candidates
- B. to specify the positions for which an individual seems ___25___.

SECTION 3

You should spend about 20 minutes on Questions 26-38, which are based on Reading Passage 3 below.

UNDERWATER BOATS

A. Efforts to build underwater boats began in Europe over 500 years ago. Although the technology was not advanced enough to create a successful submarine, several attempts were made with varying degrees of success. In 1578, English scientist William Bourne wrote of the possible use of ballast tanks (hollow tanks that possible use of ballast tanks (hollow tanks that can be filled with seawater) to enable a submersible boat to descend and rise to the surface, though he never built one himself. In 1620, Cornelis Drebbel, a Dutch inventor, created several prototype submersibles resembling two wooden rowboats, one atop the other and bound with leather for a watertight skin. These were propelled by oars that emerged from the hull through watertight openings. Drebbel tested his crafts several times below the Thames River in London, England. Historians consider Drebbel's tests the first practical use of a maneuverable submarine.

B. For the next two centuries, scientists and inventors in America, England, France, Germany, and Italy attempted to create a true submersible warship with little success. In 1776, American inventor David Bushnell designed the Turtle for use against the British ships that were blockading New York. The Turtle was an egg-shaped craft, slightly larger than an adult man, constructed of wood and designed to briefly submerged under an anchored enemy ship. Its one-man crew could propel the craft by vigorously cranking a hand-turned propeller. The boat's weapon was an explosive charge that could be screwed into the underside of the target ship's wooden hull. However, the one and only attempt to use Bushnell's craft failed when its pilot discovered that the British ships had copper-plated hulls.

C. In 1800, American inventor Robert Fulton built a 6.4-meter submarine named the Nautilus, which was similar in shape to the modern submarine. Fulton introduced two important innovations: rudders for vertical and horizontal control and compressed air as an underwater supply of oxygen. When submerged, the Nautilus was powered by a

hand-operated, four-blade propeller. On the surface, the boat was propelled by means of sails attached to a folding mast.

D. During the latter half of the 19th century, many attempts were made to develop an adequate means of submarine propulsion. Inventors experimented with compressed air, steam, and electricity as power sources. In 1898, American inventor John Philip Holland used a dual propulsion system to develop the first practical submarine with an efficient source of power. His submarine was equipped with a gasoline engine for surface cruising and an electric motor for underwater power. In 1900, the U.S. government purchased the 16.2-meter submarine and named it the USS Holland.

E. At the outbreak of World War I in 1914, submarine technology had evolved to the point that the United States, the United Kingdom, Germany and Russia had all developed diesel-powered submarines that could operate on electrical batteries underwater. The German Uboat was the most advanced. With an average of only 30 submarines at sea at any one time, the German U-boat service put a stranglehold on wartime shipping and merchant supply lines and nearly brought the United Kingdom to its knees in four years of conflict.

F. During World War II, Germany continued to develop superior U-boats. The Germans invented the snorkel, a retractable tube that could be extended above the surface of the water to capture air and to release exhaust while the submarine continues to operate unseen 18 meters below the surface. They also created streamlined hull designs and larger electric batteries to enable their submarines to travel at much higher speeds and for longer distances. After Germany surrendered in 1945, both the U.S. and Soviet navies benefited from Germany's advanced submarine technology. Postwar diesel-electric submarines made the most of these innovations, and underwater manoeuvrability and speed increased.

G. The nuclear age began in the 1950s and it led to the development of nuclear reactor power in submarines to increase range and capability. The first nuclear-powered submarine, the USS Nautilus, was developed by the Americans and launched in 1954.

In a trial run conducted in 1955, the Nautilus sailed totally submerged for an incredible distance of 2170 km in 84 hours. Its underwater cruising speed was more than 20 knots, and since the sub was nuclear-powered, it no longer needed to periodically surface for air or for refuelling.

H. During the 1990s, the U.S. Navy began allowing some of its submarines to be used for scientific missions. In 1995, for example, the U.S. Navy allowed civilian scientists to conduct missions below the polar ice caps aboard Sturgeon-class attack submarines. The agreement provided for one mission a year for five years. Access to this underwater region had been restricted for years due to the harshness of the environment.

Questions 26-29

Do the following statements agree with the views of the writer in Reading Passage 3? In boxes 26-29 on your answer sheet, write;

YES, if the statement agrees with the writer

NO, if the statement does not agree with the writer

NOT GIVEN, if there is no information about this in the passage

26. William Bourne built the first practical and manoeuvrable submarine.

27. Robert Fulton pioneered two important submarine innovations: rudders and submarine innovations: rudders and compressed air.

28. John Philip Holland developed the first submarine with an efficient source of power.

29. Germany's U-boats destroyed more ships than any other submarine during World War II.

Questions 30-34

Choose the appropriate letter, A-D, and write them in boxes 30-34 on your answer sheet.

30. In 1995, the U.S. Navy allowed some of its Sturgeon-class attack submarines

A. to be put on display in Germany as part of an international U-boat show.

B. to be sold to the general public as research vessels.

C. to be used by civilian scientists to conduct missions below the polar ice caps.

D. to be fitted with an advanced prototype hydrogen-based engine.

31. During World War II, Germany invented the snorkel, a retractable tube that ____

- A. launched torpedoes with greater accuracy.
- B. was extended above the water to capture air and to release the exhaust.
- C. was used to receive fuel from surface ships while still hidden underwater.
- D. was used to plant explosives on the hulls of enemy ships.

32. In 1898, American inventor John Philip Holland developed a submarine with ____

- A. a hand-operated propeller for underwater power and sails for surface cruising.
- B. a diesel engine capable of cruising at a speed of 20 kilometres per hour.
- C. an electric motor for surface cruising and a gasoline engine for underwater power.
- D. a gasoline engine for surface cruising and an electric motor for underwater power.

33. In 1620, Dutchman Cornelis Drebbel created several submersibles ____

- A. that resembled two wooden rowboats, one atop the other and bound with leather.
- B. that were used against the British ships that were blockading New York.
- C. that were used to conduct scientific missions below the polar ice caps.
- D. that were equipped with rudders for control and compressed air for oxygen.

34. During World War I, which country's submarines put a stranglehold on wartime shipping and merchant supply lines, nearly bringing the United Kingdom to its knees?

- A. United States.
- B. Italy.
- C. Germany.
- D. Russia.

Questions 35-38

Complete the table below. Choose **NO MORE THAN TWO WORDS** from the passage for each answer. Write your answers in boxes on your answer sheet.

Year	Development	Name of Person or People
1578	35_____	William Bourne
1776	The Turtle	36_____

37_____	First Nuclear-powered Submarine launch	The Americans
World War II	The Snorkel	38_____

Reading Test 19

SECTION 1

You should spend about 20 minutes on Questions 1-13 which are based on Reading Passage 1 below.

HOT SPRINGS ON THE OCEAN FLOOR

A. In many areas of the ocean floor, wherever magma nears the sea floor, or where lava erupts directly at the sea floor surface, hot springs on the sea floor called hydrothermal vents commonly are found. Vent fields are generally associated with submarine volcanoes where lava is erupting or preparing to erupt. Hydrothermal vents also are found in areas of the ocean floor that are spreading, such as at mid-ocean ridges, where tectonic plates are being pulled apart. This movement allows the molten magma to rise from deep inside the Earth, super heating the cold ocean water around it. The average temperature of deep-ocean water is only 2 °C (36 °F) . The water coming directly from a hydrothermal vent can reach up to 350 °C (662 °F) and is rich in dissolved chemicals. The hot spring water forms a plume above the vent, somewhat like smoke rising from a chimney into the air. Temperature sensing instruments, towed behind research vessels, can detect these hot water plumes and aid oceanographers in locating hydrothermal vents on the ocean floor.

B. Vent Circulation and Chemistry

Sea floor hydrothermal systems influence local ocean chemistry because hydrothermal circulation removes some chemical compounds from sea water, such as magnesium and sulfate, and adds many others. Further, the circulation pattern of sea water within the hydrothermal vent system creates the unique landforms and biological communities found in vent fields. Sea water enters into the sea floor by seeping down through fracture systems. As water percolates through the cracks, it heats as it nears the magma chamber. Subsurface water can heat to 60 °C (140 °F), warm enough to begin dissolving chemicals and minerals from the surrounding rock. The water becomes rich in surrounding rock. The water becomes rich in chemical compounds of sulfur, iron, and magnesium. When this vent fluid comes close to the magma chamber, it enters a high

temperature reaction zone where temperatures rise to 400 °C (752 °F). This superheated, highpressure, mineral laden vent fluid rises forcefully, searching for fracture systems or other openings to the ocean floor.

C. Black smokers form when hot vent water mixes with cold sea water, causing the precipitation of tiny particles of manganese-rich and iron-rich sulfide minerals. White smokers form from slightly cooler vent water and the precipitation of minerals rich in barium and calcium. Vent openings can be as small as several centimeters or as large as a meter or more in diameter. At these openings, the vent fluid becomes focused and expels forcefully into the surrounding cold sea water. At this point, the temperature of the vent fluid varies around 350 °C (662 °F). The reaction between the two waters of differing temperature causes some of the dissolved minerals to precipitate out, forming tiny grains in the vent fluid. The particles give the fluid the appearance of a dark cloud. Because a large percentage of the chemical compounds are sulfides, such as hydrogen sulfide, the vent fluid is highly toxic, with a PH near 4.0, or about that of vinegar. As the vent fluid rises, it slows and begins to mix with the surrounding ocean water, producing a plume of warm water that starts to drift with the currents. The plume tends to hang together as it cools, aiding in its detection. Many of the chemical and mineral compounds begin to drop from the plume, forming metalliferous sediments and iron and manganese crusts on the nearby ocean floor. Because deposits from hydrothermal vent, fluid can contain iron, manganese, copper, zinc, and other minerals, vents have relevance to certain types of ore deposits.

D. Chemosynthesis

The chemicals in hydrothermal vent fluid would be toxic to most forms of life familiar to humans; but amazingly, a unique ecosystem has evolved to live near hydrothermal vents. The organisms that are supported by the vents rely on microbes, similar to colonies of bacteria, which grow in the vent fluid and on the surface of the surrounding rocks and chimneys . The ability of microbes to create a food source from otherwise toxic chemicals provides for animal species that biologists are just beginning to understand. Because each species can tolerate certain levels of heat and toxicity, the communities form concentric rings around hydrothermal vents with each species existing in its

preferred habitat. Animals also are categorized as vent and non-vent species. Some are directly dependent on the vents for survival while others can migrate between vents and the open ocean.

E. Tubeworms are one of the most common and distinctive animals found at hydrothermal vents. Tubeworms attach themselves to the sea floor and have no mouth or anus, a notable trait found extremely amazing. Instead, they have symbiotic microbes living inside them. Tubeworms live in colonies consisting of hundreds to many thousands of individuals, with many other smaller vent species living among them. The colonies form mounds of long, white stalks topped with red, branching filaments. Numerous species of clams are found near the vents, siphoning the warm water to digest plume microbes and detritus (decaying matter) dropping from above. Gastropods such as limpets and snails move about the rocks, rasping the mat-forming microbes with their radulas. Other species of annelid worms and sea cucumbers also feed from the mat-forming microbes. Species of crabs and arthropods scrape away at the microbes as well as prey on the sedentary and slow-moving species. Some fish prefer the vent fields and can tolerate the high heat and toxins, whereas others roam between the vents in search of food. Rarely, a small gray octopus will swim by. Termed *Bentosoctopus*, it is very reclusive and not much is known about the species.

F. Colonization

When hydrothermal vents begin to develop, animal communities colonize the vents with a set progression. Plume and mat-forming microbes begin to grow almost immediately. Within a few months, fast-colonizing animals, such as tubeworms, scale worms, snails, and limpets begin to colonize hydrothermal vents. Newly colonized vents typically have few species and few individuals, and if tubeworms are present, they are white and small (generally less than 50 centimeters long, or 19.5 inches). Older, established vents have more species and more animals, and the tubeworms are brown have more species and more animals and the tubeworms are brown and larger (usually more than 50

centimeters long). Some sessile (nonmobile) and slow-colonizing animals like sponges, sea fans, and crinoids are mostly found on older lava away from active hydrothermal areas. They are sparsely distributed and colonize new lava flows and vents very slowly, often taking many years. Some species of octopus, crab, and fish are mobile and can move freely from one site to another, and can be found near either old or new lava. Hydrothermal vents do not remain active forever. Inevitably, the underground magma will cool. Vents begin to cool and go dormant.

The non-sessile animals have the ability to migrate to other active vent fields. But those species that are attached or move too slowly will perish as their heat and food source slowly dies out.

Questions 1-4

Choose the appropriate letters A—D and write them in boxes 1-4 on your answer sheet.

1. Which of the following is true of hydrothermal vents?

- A. Their numbers have been increasing.
- B. They exist in large numbers on the ocean floor.
- C. They were detected for the first time by research vessels.
- D. Only submarine volcanoes cause them.

2. What supports animal lives around vents?

- A. Bacteria.
- B. Food created from poisonous chemicals.
- C. Their ability tolerate heat and toxicity.
- D. Migration between vents and the open ocean.

3. What features of tubeworms are found intriguing?

- A. They live in a toxic environment.
- B. They have no mouth or anus.
- C. They attach themselves to the seafloor.
- D. They form colonies.

4. Which of the following species is NOT mentioned in the text to feed on microbes?

- A. Limpets.
- B. Annelid worms.
- C. Crabs and arthropods.
- D. Bentosoctopus.

Questions 5-8

The diagram below is based on the Vent Circulation and Chemistry part of the passage.

Choose NO MORE THAN THREE WORDS from the passage for each answer.

Write your answers in boxes 5-8 on your answer sheet.

Water enters the ___5___ and heats to 60 °C

↓

___6___ in nearby rocks dissolve into water

↓

Water approaches magma chamber and heats to 400 °C

↓

High-pressured mineral-rich water erupts at ___7___

↓

Fluid slows as it rises

↓

Mineral compounds drop to form ___8___

Questions 9-13

Complete the summary below.

Choose your answers from the passage.

Use NO MORE THAN THREE WORDS for each answer and write them in boxes 9-13 on your answer sheet.

The development of animal communities often follows certain procedures. Mat-forming microbes are among the first to ___9___ the vents. ___10___ tube worms are often found around newly colonized vents while ___11___ typically have larger ones with a darker color. ___12___ such as sponges and sea fans spread very slowly. Animals like ___13___ can be found at both old and new vents because they can swim at will between different sites, so unlike sessile ones they do not die out at the hydrothermal vents eventually deplete.

SECTION 2

You should spend about 20 minutes on Questions 14-27 which are based on Reading Passage 2 below.

E-BOOK

A.

Reading on paper is so much a part of our lives that it is hard to imagine anything could ever replace inky marks on shredded trees. Since Johannes Gutenberg invented an economical way to make movable metal type in the 15th century, making it possible to produce reading matter quickly, comparatively cheaply and in large quantities, the printed word has proved amazingly resilient. So how could anyone believe that sales of electronic books will equal those of paper books within a decade or so? First, it is worth remembering that paper is only the latest in long line of reading "technologies" that were made obsolete each time an improved solution emerged. Pictures drawn on rock gave way to clay tablets with cuneiform characters pressed into the clay before it dried. Clay gave way to animal skin scrolls marked with text, and then to papyrus scrolls. By AD 100 the codex had arrived, but it was not until the ninth century that the first real paper book was produced. In Europe, paper was rare until after Gutenberg's breakthrough.

B.

It took a few more centuries for e-books to emerge. They were first envisioned in 1945 by Vannevar Bush, director of the United States Office of Scientific Research and Development. In his classic essay, "As We May Think" , Bush described a gadget he called a "Memex" — "a device in which an individual stores all his books, records, and communications. Most of the memex contents are purchased on microfilm ready for insertion. Books of all sorts, pictures, current periodicals, newspapers, are thus obtained and dropped into place. Wholly new forms of encyclopedias will appear, ready-made with a mesh of associative trails running through them."

C.

Although science-fiction writers eagerly adopted Bush's ideas notably on the television show Star Trek, where portable electronic books featured regularly, the real world has remained loyal to paper. Only in the encyclopedia market, which was transformed by CD-roms in the mid-1980s, has the e-book made real progress. Far more encyclopedias, from Microsoft's Encarta to Encyclopedia Britannica, were sold on CD-rom than on paper, because they cost only a fraction of the price and are easier to search. But attempts to broaden the appeal of e-book technology to appeal to readers have been unsuccessful. Since the late 1980s the electronic publishing world has seen several failed e-book ventures. Why? Most of them used devices that were either too bulky to carry around, or forced users to "stock up" their electronic library in inconvenient ways. One even required visits to a "book bank" , an ATM-like machine that was to be located in bookstores. Before widespread adoption of the Internet, there was no universal way to download new reading material.

D.

But the most fundamental problem was the lack of a display technology that could compete with paper when it came to lucid reading. For paper books, readability depends on many factors: typeface and size, line length and spacing, page and margin size, and the color of print and paper. But for e-books there are even more factors, including resolution, flicker, luminance, contrast and glare. Most typefaces were not designed for screens and, thanks to a limited number of pixels, are just fuzzy reproductions of the originals. The result is that reading on screen is hard on the eyes and takes a lot more effort. People do it only for short documents. The longer the read, the more irritating and distracting are all the faults in display, layout and rendering.

E.

Most of these problems are now being solved. The World Wide Web offers an amazingly flexible way to deliver books and as investments in broadband infrastructure increase, it will get even easier to stock an e-library. And dozens of companies established publishing firms such as R. R. Donnelly, Penguin Putnam, and Nokia, Barnes & Noble

and Microsoft have joined to create an open e-book standard, so that booklovers will be able to read any title on any e-book. There have also been some incredible technological breakthroughs that will make it much easier to read long texts on a screen.

Microsoft has developed a font display technology called ClearType that, by manipulating the red, green and blue sub-pixels that make up the pixels on an LCD screen, improves resolution by up to a factor of three, coupled with the latest e-book reading software and hardware, this provides an on-screen reading experience that begins to rival paper.

F.

But why would anyone prefer an e-book to a pbook, regardless of improved readability? Because e-books have many other advantages. You will get instant delivery from your web bookshop to your e-book, and be able to store hundreds of novels on a device the size of a paperback. E-book technology enables you to have an entire library in your pocket. Or you can keep it on your PCs — a modern laptop can hold more than 30,000 books. You won't have to wait for out-of-stock books to be ordered, and books will never go out of "print". Your children will be able to listen to unfamiliar words pronounced for them as they read. You will have unabridged audio synchronized to the text, so you can continue the story in situations where you are unable to read, for example, while driving.

G.

In addition, e-books promise to revolutionize the way the world reads. Whereas paper books are stand-alone entities, e-books can include hypertext links to additional content, whether it is in other books, databases or web sites. So ebooks will not be restricted to a linear structure that is the same for everyone. Every reader will be free to make use of the links, images and sounds differently. You will also be able to customize e-books by adding your own notes, links and images. In a paper book, content is fixed; with e-book technology it is flexible.

H.

The e-book will also revolutionize the economics of the industry. The cost of publishing-books will fall dramatically, the result of savings on materials, labour, manufacturing and

distribution, In the process, a lot of trees will also be saved and even the most obscure author will be able to self-publish , which means more choice for readers. The retail price of books will fall; sales will explode.

I.

It is hard to imagine today, but one of the greatest contributions of e-books may eventually be in improving literacy and education in less-developed countries. Today people in poor countries cannot afford to buy books and rarely have access to a library. But in a few years, as the cost of hardware continues to decline, it will be possible to set up "virtual" public libraries which will have access to the same content as the Library of Congress.

Questions 14-18

Reading Passage 2 has 9 paragraphs A— I

From the list of headings below choose the 5 most suitable headings for paragraphs C, E, F, G, and H.

Write the appropriate numbers (i —x).

NB There are more headings than paragraphs, so you will not use them all.

List of Headings

- i. "Virtual" libraries on the horizon
- ii. The problem of lucid reading
- iii. The success of electronic encyclopedias
- iv. Early setbacks in electronic publishing
- v. Problems solved with the advent of the World Wide Web
- vi. Improved readability
- vii. Unrestrained reading experience
- viii. Easy delivery and mass storage capacities
- ix. Milestones in reading "technology" evolution
- x Accessing Library of Congress made possible

Example Answer

Paragraph A ix

- 14. Paragraph C
- 15. Paragraph E
- 16. Paragraph F
- 17. Paragraph G
- 18. Paragraph H

Questions 19-23

Classify the following statements as applying to

- A. 1980s e-book devices
- B. Memex
- C. Movable metal type
- D. ClearType
- E. Animal skin scroll

- 19. stores contents on readymade microfilms.
- 20. is a more improved solution than clay tablets.
- 21. facilitated the mass production of books in Europe.
- 22. are not easily portable.
- 23. improves resolution quality almost equal to books.

Questions 24 — 27

Complete the sentences below with words taken from the reading passage.

Use NO MORE THAN THREE WORDS for each blank. Write your answers in boxes 24-27 on your answer sheet.

- 24. _____ joins forces with Microsoft to develop e-book standards.
- 25. E-books allow users to listen to _____ read simultaneously with the text.
- 26. _____ can be added to e-books to guide readers to additional content.
- 27. Ordinary people will be free to publish their own e-books, giving readers _____.

SECTION 3

You should spend about 20 minutes on Questions 28 — 40 which are based on Reading Passage 3 below.

OPTIMISM: THE KEY TO A GOOD LIFE

A.

It's an age-old battle. Pessimists think optimists are foolish; optimists think pessimists make themselves unnecessarily miserable. A lot of research has been done on this issue in the last 30 years. Have we answered the question yet? Is the glass half-full or half-empty? Optimistic people are happier than pessimists. When something bad happens, optimists think of it as temporary, limited in its effect, and not entirely their fault. Pessimists do the opposite. They consider the setback to be permanent, far-reaching and their entire fault. There are varying degrees of this, of course; it's not black or white. Most people fall somewhere between the two extremes. The main difference between optimists and pessimists is how they explain setbacks to themselves. Optimism and pessimism both tend to be self-fulfilling prophecies. Pessimistic explanations tend to make people feel defeated — making them less likely to take constructive action. Optimistic explanations, on the other hand, make people more likely to act. If they think the setback is only temporary, people are apt to try to do something about it, and because they take action, they make it temporary.

B.

Using these definitions, researchers find that optimism contributes to good health and pessimism contributes to illness. Chris Peterson was teaching a class in abnormal psychology at Virginia Tech, when he told his students to fill out an Attributional Style Questionnaire — a carefully designed test that determines a person's level of optimism and pessimism. The students also answered questions about their general health, including how often they went to a doctor. Peterson followed the health of his students

the following year and discovered that the pessimists had twice as many infectious diseases and made twice as many trips to the doctor as the optimists. Later, Martin Seligman of the University of Pennsylvania and two of his colleagues, using interviews and blood tests, found that optimists have better immune activity than pessimists. The study shows that university freshmen who participated in a workshop on cognitive coping skills reported fewer adverse physical problems and took a more active role in maintaining their health.

C.

In the study, incoming freshmen were asked to complete a questionnaire designed to reflect their overall attitudes and coping behaviors. Seligman and Buchanan invited those students identified as the most pessimistic to participate in the study. Students were randomly assigned to attend either the 16-hour workshop or a control group. Workshop participants learned to dispute their chronic negative thoughts as well as learned social and work skills that can help avert depression. After an 18-month follow-up, the preliminary findings showed that 22 percent of the workshop participants had suffered moderate or severe depression by blind clinical diagnosis, compared with 32 percent of the control group subjects. Also, only 7 percent of the workshop participants suffered from a moderate or severe anxiety disorder, compared with 15 percent of the control group. Workshop participants also reported fewer health problems during the course of the workshop, and were more likely than control subjects to see a physician for maintenance or checkups rather than wait until they became ill. While the subjects were young and generally healthy, Buchanan speculated the study could be replicated using older more vulnerable subjects.

D.

Studies by other researchers show the same thing. Why? One big factor is that "pessimistic individuals," as Seligman writes, "get depressed more easily and more often." When a person is depressed, certain brain hormones become depleted, creating a chain of biochemical events that end up slowing down the activity of the immune system. For example, two key players in our immune systems are T cells and NK cells.

T cells recognize invaders (like viruses) and make more copies of them to kill off the invaders. Pessimists' T cells don't multiply as quickly as optimists', allowing invaders to get the upper hand; and NK cells circulate in the blood and kill whatever they come across that they identify as alien (such as cancer cells). Pessimists' NK cells can identify alien entities, but they don't destroy them as well as the optimists' NK cells. Optimists also look at information in more depth to find out what they can do about the risk factors.

E.

In a study by Lisa Aspinwall, PhD, at the University of Maryland, subjects read health-related information on cancer and other topics. She discovered that optimists spent more time than pessimists reading the severe risk material and they remembered more of it. "These are people," says Aspinwall, "who aren't sitting around wishing things were different. They believe in a better outcome, and that whatever measures they take will help them to heal." In other words, instead of having their heads in the clouds, optimistic people look. They do more than look, they seek. They aren't afraid to look into the situation because they're optimistic. Thus, for yet another reason, optimists are likely to be healthier. And it is also true that the better their health, the easier it is for them to maintain an optimistic outlook. And every effort they make to keep an optimistic attitude will reward them with a stronger immune system.

F.

The best news is what research has shown repeatedly: anyone can become more optimistic with effort. Pessimists can learn to see the temporary aspects of setbacks. They can be more specific about the effects of it, they can learn to not take all the blame and they can learn to take credit for the good they do. All it takes is practice. Optimism is simply a way of thinking about good and bad; it's a cognitive skill anyone can learn. So, what about the age-old conflict? Is the glass half-full or half-empty? The best answer is that the glass is both half-full and half-empty, but you're much better off if you think of it as half-full. When bad happens: assume it won't last long, look to see what isn't affected, and don't indulge in self-blame. When good happens: consider its effects

permanent, see how much of your life is affected, and look to see how much you can take credit for.

Questions 28-33

Do the following statements agree with the information given in Reading Passage 3.

In boxes 28-33 on your answer sheet write;

TRUE, if the statement is true

FALSE, if the statement is false

NOT GIVEN, if the information is not given in the passage

28. Studies indicate that pessimists are unhealthy.

29. Students were assigned, according to their levels of pessimism, to attend a workshop or a control group respectively.

30. Control subjects are more reluctant to see doctors and waited for their situations to worsen.

31. Pessimists' NK cells have the same function and efficiency as optimists'.

32. Lisa Aspinwall discovered that optimists have better memory than pessimists.

33. People ought to see the glass as both half-full and half-empty.

Questions 34-37

Use the information in the passage to match the people (listed A—D) with opinions or deeds (listed 34-37) below. Write the appropriate letter (A—D) in boxes 34- 37 on your answer sheet.

A. Chris Peterson

B. Lisa Aspinwall

C. Buchanan

D. Martin Seligman and colleagues

34. concludes that optimists are better aware of their situations because of the more positive attitude they take.

35. conducted a one-year study.

36. invited university freshmen to participate in a cognitive coping skills workshop.

37. suggested conducting the study on older subjects.

Questions 38-40

Choose **NO MORE THAN THREE WORDS** from the passage to complete the summary below.

Studies have identified the mechanism by which pessimists get healthier as a biochemical chain reaction. Depression inhibits the secretion of 38, which in turn reduces the efficiency of 39. Although pessimists and optimists have T cells and NK cells alike, the former's reproduce fewer T cells which detect and attack viruses. And their NK cells are less powerful in combating 40, making it possible for invaders to prevail.

Reading Test 20

SECTION 1

You should spend about 20 minutes on Questions 1-14, which are based on Reading Passage 1 below:

Hyperactivity of Children

A. For children with Attention Deficit Hyperactivity Disorder (ADHD), life can feel like a never-ending video game. They are wired — restless, impulsive, and easily distracted. Their minds are constantly bombarded with different elements of reality that compete for their attention. So far, the most popular treatment for ADHD has been Ritalin, a rapid-acting stimulant for adults that has the opposite effect in children, calming the jitters associated with the disorder. According to the National Institute of Mental Health, about three percent of American schoolchildren take stimulants like Ritalin regularly. However, current research suggests a surprising new strategy for treating this disorder: video games linked to brain-wave biofeedback that can help kids with ADHD train their minds to tune in and settle down.

B. It is difficult for a child with ADHD to learn how to self-regulate and know what it feels like to concentrate. Biofeedback teaches patients to control normally involuntary body functions such as heart rate by providing real-time monitoring of such responses. More than 15 monitoring of such responses. More than 15 years of studies show that with the aid of a computer display and an EEG sensor attached to the scalp, ADHD patients can learn to modulate brain waves associated with focusing. Increasing the strength of high-frequency beta waves and decreasing the strength of low-frequency theta waves, for example, creates a more attentive state of mind. With enough training, changes become automatic and lead to improvements in grades, sociability, and organizational skills.

C. Despite its proven success, the technique has not become a mainstream treatment for several good reasons. First, unlike drug therapy, which good reasons. First, unlike drug therapy, which can have immediate results, a typical course of biofeedback treatment takes a series of about 40 one-hour sessions over a span of several months before benefits become apparent. Second, it is more expensive than drugs. Costs range

from \$3,000 to \$4,000 for these treatments, so insurance companies tend to pick the less expensive option. Finally, biofeedback training requires the very kind of prolonged concentration that patients with ADHD struggle to attain.

D. Alan Pope, a behavioural scientist at NASA Langley Research Centre in Hampton, Virginia, came up with a more engaging approach through work with NASA flight simulators. He was determining the degree of interaction with cockpit controls necessary to help pilots stay attentive during routine flights. In an experiment, he linked the level of automation in the cockpit to the pilots' brain-wave signals, so that some controls switched from autopilot to manual when the pilot started to lose focus. He found that with practice the pilots could begin to adjust the controls to the level of automation that felt most comfortable by regulating their own brain waves. Pope applied his findings to help ADHD patients stay focused on rewarding an attentive state of mind. He realized, however, that the simple displays that were already part of biofeedback treatment may not be enough to hold the interest of restless youngsters. He then chose several common video games and linked the biofeedback signal from the player's brain waves to the handheld controller that guides the games' actions. "In one auto-racing game, a car's maximum speed increases if the player's ratio of beta to theta waves improves. The same sort of feedback also controls the steering," Pope says.

E. In the test, six Sony PlayStation games were used with 22 boys and girls between the ages of nine and thirteen who had ADHD. Half the group received traditional biofeedback training; the other half played the modified video games. After 40 one-hour sessions, both groups showed substantial improvements in everyday brainwave patterns as well as in tests of measuring attention span, impulsiveness, and hyperactivity. Parents in both groups also reported that their children were doing better in school. The difference between the two groups was motivation. "In the video-game group, there were fewer no-shows and no dropouts," according to Pope. The parents were more satisfied with the results of the training, and the kids seemed to have more fun.

F. Since children are more motivated toward video-game biofeedback and may already be familiar with video games, they will not need one-on-one coaching to master the technique. As a result, the cost of the treatment should be reduced and maybe even

permit "do-it-yourself" biofeedback. One North Carolina company markets their system as a fun bike helmet and game-like video exercises that work on almost any computer. The helmet is lined with sensors that monitor the child's brain waves, and the child actually controls the computer video exercises by mind alone. Parents should not expect regular video games to help their children. The wrong kinds of video games might actually hurt children with attention disorders.

G. Parents, however, may be hesitant to switch from traditional treatment programs. One parent whose child currently takes drugs to control ADHD says, "Our son is using drugs to control his attention problems and although we don't like giving him the pills, he is no longer causing problems at school. We try to keep our son away from things that might make him hyperactive. Unless our doctor tells us to do this brain-wave training in a hospital, we are not going to buy a machine to do our own treatment at home." Brain-wave biofeedback alone may not be a substitute for drug therapy. Professor Stephen Hinshaw, an expert in the field of child clinical psychology at UC Berkeley, gives a reserved opinion about biofeedback treatment. "Biofeedback is a promising potential alternative, but unfortunately the kinds of really well-controlled studies that might support its clinical benefits have yet to be performed." The two treatments have complementary aspects that make them effective as adjuncts. A single dose of Ritalin, for example, acts quickly but only for a few hours, and most patients take it only on school days. Brain-wave regulation takes a long time to learn but has the potential for longer-lasting effects.

H. Researchers and clinicians are realizing that ADHD is not easily outgrown. Most doctors support an approach that combines good nutrition, sleep, exercise, and learning strategies as well as biofeedback and drug therapy. The possibilities for brain-wave biofeedback are very promising since its benefits could last a lifetime. Video-game biofeedback therapy may provide a more tolerable and long lasting form of treatment for children through a medium they are more likely to enjoy.

Questions 1— 4

Complete the sentences below with words taken from the reading passage. Use **NO MORE THAN THREE WORDS** for each answer.

1. Easily distracted and impulsive are words that mean the same as_____.

2. Ritalin_____the jitters in children.
3. Biofeedback helps children to learn how to control_____.
4. ADHD patients struggle to attain_____.

Questions 5 — 8

Do the following statements agree with the views of the writer in Reading Passage 1?

YES, if the statement agrees with the views of the writer

NO, if the statement contradicts the views of the writer

NOT GIVEN, if it is impossible to say what the writer thinks about this.

5. Pilots naturally are able to regulate their own brain waves.
6. Pope sought to reward his patients' attentive state of mind.
7. Increased theta waves increase the car's maximum speed Pope's auto-racing game.
8. Modified video games produce more substantial improvements than traditional biofeedback training.

Questions 9 -14

Complete the summary below.

Choose your answers from the box and write them in boxes 9 - 14 on your answer sheet.

NB There are more words than spaces so you will not use them all.

As children find videogame biofeedback more motivating they do not need 9_training. This results in the 10 becoming lower. One company has 11___ game-like video exercises that work on almost all computers. Some parents are 12_to move towards video-game biofeedback. Prof. Hinshaw says that biofeedback is a 13_alternative but most doctors suggest learning strategies and good 14_as well as sleep and exercise.

SECTION 2

You should spend about 20 minutes on Questions 15 – 27, which are based on Reading Passage 2 below.

SKYSCRAPERS

A. The word skyscraper was originally a nautical term for a tall mast or sail on a sailing ship. Today the word is used exclusively to refer to a tall habitable building, usually higher than 150 metres (500 feet). Most skyscrapers serve as office buildings or hotels. The term a "high-rise" is also used to describe tall buildings, but it tends to be applied specifically to residential buildings. The modern building of great height, constructed on a steel skeleton originated in the United States.

B. Until the 19th century, buildings of over six stories were rare. It was impractical to have stories were rare. It was impractical to have people walk up so many flights of stairs, and water pressure could only provide running water to about 50 feet (15 m). Many mechanical and structural developments in the last quarter of the 19th cent, contributed to the evolution of the building. With the perfection of the high-speed elevator after 1887, skyscrapers were able to attain. The any desired height, earliest tall buildings were of solid masonry construction, with the thick walls of the lower stories usurping a disproportionate amount of floor space. In order to permit thinner walls through the entire height of the building, architects began to use cast iron in conjunction with masonry. This was followed by cage construction, in which the iron frame supported the floors and the masonry walls bore their own weight.

C. The next step was the invention of a system in which the metal framework would support not only the floors but also the walls. This innovation appeared in the Home Insurance Building in Chicago, designed in 1883 by William he Baron Jenney — the first building to employ steel skeleton construction and embody the general characteristics of a modern skyscraper. The subsequent erection in Chicago of a number of similar buildings made it the centre of the early skyscraper architecture. In the 1890s the steel frame was formed into a the 1890s the steel frame was formed into a completely riveted

skeleton bearing all the structural loads, with the exterior or thin curtain walls serving merely as an enclosing screen.

D. Heating and air conditioning played an important role in the structure of skyscrapers. They are the key units that control the inside atmosphere of all skyscrapers. In the early days, the heat sources in the building came from fireplaces and stoves. Later on the heat in the building supplied by the hot water boiler. The boiler heats up the water and sends it out to the radiators through a system of pipes. This was later replaced by the central heating furnace with ventilation ducts that channel heat to various areas of the building. Air condition originated from refrigeration. The process of refrigeration is to draw heat away from substances to lower their temperature. Today, the skyscrapers use the central heating system with ventilation ducts that can be shared with the heating and air conditioning system. Engineers are working on new ways to make heating and air conditioning more efficient and environmentally friendly.

E. In 1892, the New York Building Law made its first provisions for skeleton constructions. There followed a period of experimentation to devise efficient floor plans and aesthetically satisfying forms. In 1916, New York City adopted the Building Zone Resolution, establishing legal control over the height and plan of buildings and over the factors relating to health, fire hazard, and assurance of adequate light and air to buildings and streets. Regulations regarding the setting back of exterior walls above a determined height, largely intended to allow light to reach the streets, gave rise to buildings whose stepped profiles characterize the American skyscraper of subsequent years.

F. With the complex structural and planning problems solved, architects still seek solutions to the difficulties of integrating skyscrapers with community requirements of hygiene, transportation, and commercial interest. In New York during the 1950s, public plazas were incorporated into the designs of the Lever House by Gordon Bunshaft and the Seagram Building of Mies van der Rohe. These International style buildings are also examples of the effective use of vast expanses of glass in skyscrapers. More recently, numerous skyscrapers have been constructed in a number of postmodern modes.

G. The cost of building a skyscraper is a hundred million dollars in the current market. The skyscraper is well known for its great height and the social status that comes with it, and has always been associated with wealth and power. To the general public, big is good; in terms of building, the taller the better. In general, a large company or firm would host its head office in these skyscrapers. For example, Chrysler had its head office in the Chrysler Building, owned by Chrysler, which is one of the big three automakers. The Sears Tower, the head office for Sears and owned by Sears. It was known for being the worlds' tallest skyscraper in Chicago. Tenants expect clients to know where they are located when they tell them the Sears Tower as their location. These skyscrapers are owned by wealthy individuals, who are in the upper level of financial social status. There is a sense of prestige for having offices or shops in these skyscrapers.

H. Modern skyscrapers are being redefined by the use of advance technologies. Thanks to the advancement in technology, skyscrapers are able to reach new height easily. It changes the way architects design the structure of these buildings. The new function of the skyscraper is to provide great views, house antennas for communications, tele-broadcasting and for entertainment purpose. The use of computer climate control system made the building a more comfortable environment for everyone. The great height of the skyscraper-like the Sears Tower, it associates itself with the prestige of being the tallest of all. With the rapid advancement of technology and the influence of fame and wealth, the sky will be the only limit for the next generation of skyscrapers.

Questions 15 – 18

Reading Passage 2 has 8 paragraphs A -H From the list of headings below choose the most suitable headings for paragraphs A -D.

Write the appropriate numbers (i -viii).

NB There are more headings than paragraphs so you will not use all of them.

List of Headings:

- i. Hot water boiler and refrigerator
- ii. A period of innovation
- iii. Skyscraper and a tall must
- iv. Advanced technology
- v. Words for tall buildings
- vi. The wall evolution
- vii. Hot and cold

viii. From stone to iron

- 15. Paragraph A
- 16. Paragraph B
- 17. Paragraph C
- 18. Paragraph D

Questions 19 — 22

Match the following innovations with A, B, C, and D

- A. mid 20th century
- B. late 1880's
- C. 1890's
- D. early 1880's

- 19. the high-speed elevator
- 20. public square
- 21. steel framework
- 22. riveted skeleton

Questions 23 — 27

Do the following statements agree with the information given in Reading Passage 2? In boxes 23 — 27 on your answer sheet write

- TRUE, if the statement is true
- FALSE, if the statement is false
- NOT GIVEN, if the information is not given in the passage.

- 23. A skyscraper is both a tall sailing mast and a tall habitable building.
- 24. A steel frame is able to support both floors and walls.
- 25. The central heating system provides both heating and air conditioning.
- 26. In the early 20th century, architects solved the problems of mixing skyscrapers with community needs.
- 27. The higher level the company is situated in a skyscraper, the higher reputation the company holds.

SECTION 3

You should spend about 20 minutes on Questions 28 — 40, which are based on Reading Passage 3 below:

The Gray Worker

A. The 21st century may be known as the era of lifelong learning and lifelong working. Retirement, the end stage of a linear working life, may be replaced with a learning, working, leisure, life cycle. Full-time work may be interspersed with periods of flexible working arrangements such as part-time, seasonal, occasional, and project work. The traditional notion of retirement may be replaced with lifelong working-in various positions and in varying amounts of time throughout adult life. In the future, a declining birthrate may result in a shortage of skilled and knowledgeable employees, making the notion of retirement for older workers a serious drain on organizational productivity. Increasing demands for workforce productivity, a projected shortage of skilled and experienced workers, and older adults who are healthier and living longer than previous generations are powerful societal forces shaping future employment practices.

B. Two decades ago, Sheppard and Rix forecast the changing nature of the workplace and suggested that keeping older persons in the workforce would make sound economic and social policy sense. The trend toward longer periods of employment is beginning to become evident. Forced retirements and early retirement incentives have contributed to the decline of expertise in the workplace. Inflation, increasing health care costs, and inadequate pensions are propelling older adults to remain in or reenter the workforce past the traditional retirement age. Retirement as permanent separation from the workplace is being replaced with the idea of bridge employment. Bridging is a form of partial retirement in which an older worker alternates periods of disengagement from the workplace with periods of temporary, part-time, occasional, or self-employed work. The key aspect of bridging is that it is work in other than a career job. In the US, among workers age 60, more than 50percent retire from a career job but only one in nine actually disengages from the workplace. Bridging allows older workers to "practice" retirement,

to fill labour market shortages, or to try a variety of occupational positions after an initial period of retirement.

C. Bridging is sometimes described as a second career. The American Association of Retired Persons received 36,000 responses to a working life survey, covering 375 job titles from workers age 50 plus, who had returned to the workplace after an initial period of retirement. The three most frequently cited reasons for returning included having financial need, liking to work, and keeping busy. However, a closer examination of the data revealed that "financial need" included money to help the children as well as to meet basic needs. "Liking to work" included feeling successful, enjoying the excitement of the workplace, and making a contribution. "Keeping busy" included working with a spouse, staying healthy, or fulfilling a social need. Reasons cited for remaining or returning to the workplace expressed the social meaning of work. Ginzberg proposed that work provides income, status, and personal achievement; structures time; and provides opportunities for interpersonal relationships. In the study by Stein, Rocco, and Goldenetz in 2000, older workers remaining in or returning to the workplace mentioned not planning wisely, the need to contribute, appreciation from others, and the desire to create something as reasons for not retiring from the workplace. Work is more than earning a living. It is a way to live.

D. To some extent, older workers remain in the workplace because they are healthier, cognitively able and want to remain engaged. In cognitively able, and want to remain engaged. In a review of older worker studies, Rix concluded that many ageing workers continue to work at peak efficiency and that there is usually much more variation within age groups than among age groups. Shea summarized the studies on older workers by pointing out that "age-related changes in physical ability, cognitive performance, and personality have little effect on workers' output except in the most physically demanding tasks". Farr, Tesluk, and Klein found that there is no consistent relationship between age and performance across settings. Among faculty in the sciences, age had a slight negative relationship to publishing productivity. Some studies have shown a stronger negative relationship between age and work performance for nonprofessional and low-level clerical jobs than for higher-level craft, service, and professional jobs. With declining

birthrates and an anticipated shortage of new entrants to the workforce, early retirement will become an issue for organizations to explore in more detail. Organizations will need to assess the consequences to profits and productivity of encouraging talented and wise elders to exit the workforce. As a society, we need to recognize all of the costs of supporting a nonworking population capable of productive work and living healthier and longer lives.

E. Organizations need to rethink allocating opportunities to older workers as well as changing the attitudes and expectations of managers and younger employees toward an increasing number of older workers. There is a growing interest among organizations to re-engineer the work environment to account for physiological changes, due to ageing and to reorganize work schedules to account for seasonal or contingent labour pools, composed of older workers. Few positions in our information society remain static and do not require some type of education. Education and job redesign are the means by which the older segment of the community can enter, reenter, and advance in the workplace. Older workers represent a rich source of experience, accumulated knowledge, and wisdom. The quality and sensitivity of an institution's program for counselling, training, retraining, and preparing older workers for life and career transition might be the means by which organizations recruit and retain valued and productive workers.

Questions 28 — 31

Choose the appropriate letters A— D and write them in boxes 28 — 31 on your answer sheet.

28. Organizational productivity will seriously be affected in future by

- A. older adults who are healthier.
- B. the declining birthrate.
- C. _____ lifelong _____ working.
- D. the retirement of older workers.

29. Older adults are returning to the workplace because of

- A. early retirement incentives.
- B. the decline of expertise.
- C. cost of living.

D. forced retirements.

30. Partial retirement is a key opportunity for older workers to

- A. continue their career.
- B. try a new job.
- C. disengage from the workplace.
- D. remain in their job.

31. One reason not mentioned for returning to the workplace was

- A. appreciation from others.
- B. meeting basic needs.
- C. feeling successful.
- D. keeping fit.

Question 32

Answer the following question, USING NO MORE THAN THREE WORDS from the passage for each blank.

32. Name the three reasons for not retiring from the workplace, according to the study in 2000.____,____, and____.

Questions 33 — 36

Complete the summary below Choose NO MORE THAN THREE WORDS from the passage for each answer

Rix found that many older workers___33___at maximum efficiency while Shea found that age-related changes had___34___on their productivity unless they had jobs that were___35___. According to Fan, Tesluk and Klein, there was a___36___relationship in higher-level professions.

Questions 37 — 39

Do the following statements agree with the information given in Reading Passage 3? In boxes 37 — 39 on your answer sheet write

TRUE, if the statement is true

FALSE, if the statement is false

NOT GIVEN, if the information is not given in the passage.

37. Organizations need to examine in more detail the reasons for declining birth rates.

38. Profits and productivity of organizations may fall because of early retirement.

39. Older workers will be needed in the education and design fields.

Question 40

40. From the list below choose the most suitable title for the whole of Reading Passage 3.

- A The New Meaning of Retirement
- B Warning, the Society is Aging
- C Reasons for Not Retiring
- D Liking to Work
- E Concern about Future Employment

Reading test 21

SECTION 1

You should spend about 20 minutes on Questions 1 – 13 which are based on Reading Passage 1 below.

THE GEODESIC DOME - THE HOUSE OF THE FUTURE?

A.

R. Buckminster Fuller spent much of the early 20th Century looking for ways to improve human shelter by applying modern technological know-how to shelter construction, making shelter more comfortable and efficient, and more economically available to a greater number of people. After acquiring some experience in the building industry and discovering the traditional practices and perceptions which severely limit changes and improvements in construction practices, Fuller carefully examined, and improved, interior structure equipment, including the toilet, the shower, and the bathroom as a whole. He studied structure shells, and devised a number of alternatives, each less expensive, lighter, and stronger than traditional wood, brick, and stone buildings.

B.

In 1944, the United States suffered a serious housing shortage. Government officials knew that Fuller had developed a prototype of family dwelling which could be produced rapidly, using the same equipment which had previously built war-time airplanes. They could be "installed" anywhere, the way a telephone is installed, and with little additional difficulty. When one official flew to Wichita, Kansas to see this house, which Beech Aircraft and Fuller built, the man reportedly gasped, "My God! This is the house of the future!" Soon, unsolicited checks poured in from people who wanted to purchase this new kind of house, but Fuller was never able to get it into full production. This was due to many obstacles such as only union contractors were able to hook the houses up to water, power and sewers in many cities.

C.

However, because the houses were already wired and had the plumbing installed by the aircraft company, many construction trade unions made it clear that they would not work on the houses. There were also in-house differences between Fuller and the stockholders. Fuller did not feel the house design was complete; there were problems he wanted to fix. But the stockholders wanted to move ahead. However, the main obstruction was obtaining the financing for the tooling costs, which were purposefully not included in the negotiations with investors. No bank would finance the project with union problems and stockholder battles. After the war, Fuller's efforts focused on the problem of how to build a shelter which is so lightweight, it can be delivered by air. Shelter should be mobile which would require great breakthroughs in the weight-reduction of the materials. Technology would have to follow nature's design as seen by the spider's web which can float in a hurricane because of its high strength-to-weight ratio. New shelter would have to be designed that incorporates these principles and that was Fuller's intent.

D.

One of the ways Buckminster Fuller would describe the differences in strength between a rectangle and a triangle would be to apply pressure to both structures. The rectangle would fold up and be unstable but the triangle withstands the pressure and is much more rigid - in fact the triangle is twice as strong. This principle directed his studies toward creating a new architectural design, the geodesic dome, based also upon his idea of "doing more with less." Fuller discovered that if a spherical structure was created from triangles, it would have unparalleled strength. The sphere uses the "doing more with less" principle in that it encloses the largest volume of interior space with the least amount of surface area thus saving on materials and cost. Fuller reintroduced the idea that when the sphere's diameter is doubled it will quadruple its square footage and produce eight times the volume.

E.

The spherical structure of a dome is one of the most efficient interior atmospheres for human dwellings because air and energy are allowed to circulate without obstruction. This enables heating and cooling to occur naturally. Geodesic shelters have been built

all around the world in different climates and temperatures and still they have proven to be the most efficient human shelter one can find. More specifically, the dome is energy efficient for many reasons: its decreased surface area requires less building materials; exposure to cold in the winter and heat in the summer is decreased because, being spherical, there is the least surface area per unit of volume per structure; the concave interior creates a natural airflow that allows the hot or cool air to flow evenly throughout the dome with the help of return air ducts; extreme wind turbulence is lessened because the winds that contribute to heat loss flow smoothly around the dome; it acts like a type of giant down-pointing headlight reflector and reflects and concentrates interior heat. This helps prevent radiant heat loss.

F.

The net annual energy savings for a dome owner is 30% less than normal rectilinear homes according to the Oregon Dome Co. This is quite an improvement and helps save the environment from wasted energy. Domes have been designed by Fuller and others to withstand high winds and extreme temperatures as seen in the Polar Regions. Many dome manufacturers offer various designs in geodesic dome housing with little assembly time required. Some houses can be assembled in less than a day with others taking up to six months. Many also come in dome kits that buyers can build themselves or with the help of friends. R. Buckminster Fuller's first worldwide acceptance by the architectural community occurred with the 1954 Triennale where his cardboard dome was displayed for the first time. The Milan Triennale was established to stage international exhibitions aimed to present the most innovative accomplishments in the fields of design, crafts, architecture and city planning.

G.

The theme for 1954 was Life Between Artifact and Nature: Design and the Environmental Challenge, which fit in perfectly with Fuller's work. Fuller had begun efforts towards the development of a Comprehensive Anticipatory Design Science, which he defined as, "the effective application of the principles of science to the conscious design of our total

environment in order to help make the Earth's finite resources meet the needs of all humanity without disrupting the ecological processes of the planet." The cardboard shelter that was part of his exhibit could be easily shipped and assembled with the directions printed right on the cardboard. The 42-foot paperboard Geodesic was installed in old Sforza garden in Milan and came away with the highest award, the Gran Premio.

Questions 1 - 2

Choose the appropriate letters A – D and write them in boxes 1 – 2 on your answer sheet.

1. In 1944, government officials were interested in Fuller's family dwelling because

- A. they had a housing shortage.
- B. it is the house of the future.
- C. it could be produced rapidly and installed easily.
- D. all of the above.

2. Fuller's family dwelling was not fully produced mainly because

- A. aircraft company installed these houses
- B. there were financing problems
- C. union contractors did not support Fuller
- D. Fuller and the stockholders held different ideas

Questions 3 - 7

Classify the following descriptions as referring to

The sphere S
The rectangle R
The triangle T

Write the appropriate letters in boxes 3 – 7 on your answer sheet.

NB You may use any answer more than once.

- 3. doing more than less
- 4. stable
- 5. allowing natural air circulation
- 6. rigid
- 7. flowing

Questions 8 - 13

Do the following statements agree with the information given in Reading Passage 1?

In boxes 8 – 13 on your answer sheet write:

TRUE, if the statement is true

FALSE, if the statement is false

NOT GIVEN, if the information is not given in the passage.

8. A geodesic dome is basically a spherical structure created from rectangles.
9. It has been proved that the geodesic dome is the most efficient human shelter.
10. Domes are the environment-friendly building.
11. Some scientists set up domes in the Polar Regions.
12. Domes are much cheaper than traditional houses.
13. Fuller won the Gran Premio in 1954.

SECTION 2

You should spend about 20 minutes on Questions 14 – 26 which are based on Reading Passage 2 below.

Questions 14 - 18

Choose the most suitable headings for paragraphs B - F from the list of headings below.

Write appropriate numbers (i-x) in boxes 14 - 18 on your answer sheet.

NB There are more headings than paragraphs, so you will not use them all.

List of Headings

- i. Clothing symbolising status
- ii. The factors determining the dye's quality
- iii. The invaluable colour
- iv. The importance of plants in ancient times
- v. From family to industry
- vi. The value of colours
- vii. Dyestuff sources in the past
- viii. Availability and durability of a dye
- ix. The competitive and secret industry
- x. Pigments, insoluble colouring materials

- 14. Paragraph B
- 15. Paragraph C
- 16. Paragraph D
- 17. Paragraph E
- 18. Paragraph F

DYES AND PIGMENTS

A.

Dyeing is a process of colouring materials, or cloth fibers, whereby the colour becomes part of the fiber. The fastness of the colour, or its permanency, depends upon the dye

and the process used. True dyeing is a permanent colour change, and the dye is absorbed by, or chemically combined with, the fiber.

B.

In ancient times all the dyes used were natural; actually, this was true up until mid-1800. The dyestuffs came from a variety of natural sources, some commonly available, others rare or difficult to produce. Some of the common dyes included logwood or quercitron, fustic, woad, and indigo. An example of the rare dyes would be cochineal and Tyrian purple. Collectively, these substances are called dyestuffs, and were occasionally traded as a commodity. The dyestuffs were extracts from plants, mollusks, insects, woods, or naturally occurring minerals. There are many plants which produce dye suitable in the dyeing process, and many were heavily cultivated. Madder and woad were grown in Europe specifically for their dyeing properties. Saffron was also extensively grown in Anatolia for its yellow dye. Probably one of the most famous dyes was Tyrian purple, from a Mediterranean shellfish. The Phoenicians of Tyre, in Lebanon, produced this very expensive dye long before written history began. Many other areas had special dyes which were famous in antiquity.

C.

The value of a dye is not just its availability, but also its fastness or durability against daily use. It must withstand washing, wearing, sunlight, perspiration, without losing an appreciable amount of its colour. The colour, and its brightness, also helped determine the dye's value. Premium colours were purple, blue, and bright shades of red.

D.

There are two classifications of dyeing, the home craft and the trade, or industrial, dyeing. The manufacturing of clothing, the spinning, weaving and embroidery, tended to stay within the family unit. An exception to this would be the carpets made in Anatolia and Persia, for example, or the very fine, sheer linen woven in Egypt. But the manufacture of dyes and their use in dyeing yarn and cloth soon became an industry, supporting large numbers of people, even entire cities. The art of dyeing was one of the earliest arts known

to man after he became civilized. Trade dyeing was, however, a highly competitive business. These were the professionals of the ancient world when it came to dyed cloth. Many of the processes were closely guarded secrets, and many of the special skills were handed down over generations. The ingredients may come from far away; the tools may be specialized and the process often was steeped in superstition.

E.

As far back as man can historically see, rulers have set themselves apart from everyone else by wearing exotic and rare items, and dyed clothing was very early a part of this status proclamation. Still today the important and the wealthy prefer to wear items not available to all. In Egypt, the pharaohs wore specially made clothing, dyed with colours difficult to obtain. Dyed fabrics from tombs of early Egyptian attest to the antiquity of the dyers art.

F.

In the ancient Greek and Roman world, Tyrian purple became the colour of choice for rulers and emperors. The dye was extremely expensive, therefore, available to only a few. When in later times merchants, considered unimportant, became wealthy enough to buy purple-dyed cloth, laws were passed to prevent their diluting the impressiveness of the colour. Only rulers, or emperors, were allowed to wear purple. Later, however, the law was changed to include the rulers' family; then senators; and so on, eventually losing its status. This is where the phrase "born to the purple" came from.

G.

The word pigment comes from the Latin "pigmentum" meaning coloured material. Pigments are generally distinguished from dyes as colouring materials on the basis of their soluble ability (solubility) characteristics. Pigments are used mainly in the colouration of paints, printing inks and plastics, although they are used to a certain extent in a much wider range of applications including textiles, ceramics, paper, and cosmetics. In contrast to dyes, pigments are highly insoluble colouring materials, which are incorporated into an applications medium by dispersion, and they remain as discrete

solid particles held mechanically within a polymeric matrix. Pigments are thus required to resist dissolving in solvents, which they may contact in application to minimize problems such as 'bleeding' and migration. In addition to solvent resistance, pigments are required to be fast to light, weathering, heat and chemicals such as acids and alkalis to a degree dependent on the demands of particular application.

Natural inorganic pigments, derived mainly from mineral sources, have been used as colourants since pre-historic times and a few, notably iron oxides, remain of some significance today. The origins of the synthetic inorganic pigment industry may be traced to the introduction of Prussian blue in the early 18th century, pre-dating the synthetic organic colourant industry by some 150 years. The organic pigments are the oxides, sulfides, hydroxides, silicates, sulfates and carbonates of metals. The colour of a pigment is due to its interactions with light by scattering and absorption.

H.

The synthetic organic pigment industry emerged towards the end of the 19th century out of the established synthetic textile dyestuffs industry. Many of the earliest organic pigment were known as 'lakes'. These products were prepared from established water soluble dyes by precipitation on to an insoluble inorganic substrate. A further significant early development in organic pigments was the introduction of a range of azo pigments. One of the most critical events in the development of the organic pigment industry was the discovery, in 1928, of copper phthalocyanine blue. This was the first pigment to offer the outstanding intensity and brightness of colour typical of organic pigments, combined with an excellence range of fastness properties, comparable with many inorganic pigments. Organic pigments generally provide higher intensity and brightness of colour than inorganic pigments. However, organic pigments are unable to provide the degree of opacity offered by most inorganic pigments which have the lower reflectance.

Questions 19 - 21

Choose the appropriate letters A – D and write them in boxes 19 – 21 on your answer sheet.

19. Among the following dye colours, which one had superior value in the past?

- A. yellow
- B. red
- C. blue
- D. white

20. The pharaohs wore specially dyed clothing, because

- A. it was difficult to obtain.
- B. it was exotic and rare.
- C. it distinguished them.
- D. it attested to the antiquity of the dyers art.

21. According to the passage, the phrase “born to the purple” describes someone who

- A. has a royal birth
- B. is very wealthy
- C. extremely favors the purple colour.
- D. was born with silver spoon.

Questions 22 - 26

Complete the summary below.

Choose no more than three words from the passage for each answer. Write your answers in boxes 22 – 27 on your answer sheet.

As colouring materials, the distinguished characteristic of pigments is that they are more ___22___ than dyes, and in the colouring process, dyes are ___23___ by the materials, while pigments work by ___24___. Compared with inorganic pigments, organic pigments give colour higher ___25___, but lower ___26___.

SECTION 3

You should spend about 20 minutes on Questions 27 – 40 which are based on Reading Passage 3 below.

SPIDER SILK

A.

Spider silk is not a single, unique material - different species produce various kinds of silk. Some possess as many as seven distinct kinds of glands, each of which produces a different silk. Why so many kinds of silk? Each kind plays particular roles. All spiders make so-called dragline silk that functions in part as a lifeline, enabling the creatures to hang from ceilings. And it serves as a constant connection to the web, facilitating quick escapes from danger. Dragline silk also forms the radial spokes of the web; bridge line silk is the first strand, by which the web hangs from its support; yet another silk forms the great spiral.

B.

The different silks have unique physical properties such as strength and elasticity, but all are very strong compared to other natural and synthetic materials. Dragline silk combines toughness and strength to an extraordinary degree. A dragline strand is several times stronger than steel, on a weight-for-weight basis, but a spider's dragline is only about one tenth the diameter of a human hair. The movie Spider-Man drastically underestimates the strength of silk - real dragline silk would not need to be nearly as thick as the strands deployed by the web-swinging hero in the movie. Dragline silk is a composite material comprised of two different proteins, each containing three types of regions with distinct properties. One of these forms an amorphous (non-crystalline) matrix that is stretchable, giving the silk elasticity.

C.

When an insect strikes the web, the stretching of the matrix enables the web to absorb the kinetic energy of the insect's flight. Embedded in the amorphous portions of both

proteins are two kinds of crystalline regions that toughen the silk. Although both kinds of crystalline regions are tightly pleated and resist stretching, one of them is rigid. It is thought that the pleats of the less rigid crystals not only fit into the pleats in the rigid crystals but that they also interact with the amorphous areas in the proteins, thus anchoring the rigid crystals to the matrix. The resulting composite is strong, tough, and yet elastic. Then, why doesn't a spider get stuck on its own web? Over the years, three explanations for this phenomenon have surfaced.

D.

The first invokes an oil, secreted by the spider, that serves as an anti-stick agent. The problem with this hypothesis is that such an oil has yet to be discovered. The second scenario is based on the diversity of silks. Many webs include strands made of silks that are much less sticky than the others are. The non-sticky strands appear in the hub of the web, the radial spokes and the threads by which the web hangs from plants or other supports. Some researchers have thus posited that the arachnids use only these strands when navigating their webs. If you watch them in action, however, you will see that although they do seem to prefer the non-sticky strands, the spiders are able to move around freely, touching many of the strands, including the very sticky ones that spiral out from the hub.

E.

The third explanation appears to solve the sticky-strand problem. In short, the legs of at least some spiders feature a disengaging mechanism that enables the arachnid to detach itself instantly from a sticky strand. This mechanism involves a clever anatomical adaptation. Each leg ends in a pair of "walking claws" that grasp vegetation, among other functions, but a third claw collaborates with associated spiny, elastic hairs to detach the leg from a sticky web strand. This third claw grasps the strand, pulls it against the elastic hairs, and pulls them further, cocking the mechanism. When the claw relaxes, the hairs rebound vigorously, throwing the strand away and springing the leg free.

F.

Police, the military, physicians, and other groups are eager to obtain large quantities of dragline silk, which can be woven or compacted to make bulletproof clothing, replacement ligaments, medical sutures, fishing line, ropes for rock climbers, tethers to snag planes landing on aircraft carriers and myriad other products. It is impracticable to harvest sufficient quantities of silk from spiders due to their territorial nature, so biotechnologists have turned to other sources. The Canadian company Nexia has demonstrated that goats and cows can be genetically engineered so as to produce dragline silk in their milk. Using a clone of such goats, Nexia aims to produce a modified dragline silk, which they call BioSteel, to meet the many demands.

Questions 27 - 29

Write no more than three words for each answer.

- 27. Which organ of spiders produces silk?
- 28. What kind of silk helps spiders to escape from danger?
- 29. Name three features of dragline silk mentioned by the writer.

Questions 30 - 32

Write no more than three words for each answer.

Name three types of regions of proteins constituting dragline silk.

- 30. _____
- 31. _____
- 32. _____

Questions 33 – 37

Do the following statements agree with the information given in Reading Passage 3?

In boxes 33 – 37 on your answer sheet write.

- TRUE, if the statement is true
- FALSE, if the statement is false
- NOT GIVEN, if the information is not given in the passage

- 33. The spider discharges an oil to avoid sticking on its own web.
- 34. The spider use only non-sticky strands when moving on the web.
- 35. Bridgeline silk belongs to non-sticky strands.
- 36. BioSteel is a biotechnological name for spiders' dragline silk.
- 37. According to the writer, the silk Spider-Man used in the movie i s less strong than the real dragline silk.

Questions 38 - 40

Complete the diagram below based on the third explanation in Reading Passage 3.

Write no more than three words for each answer.

Example

the

strand

- 38. A: _____
- 39. C: _____.
- 40. D: _____.

Reading Test 22

SECTION 1

You should spend about 20 minutes on Questions 1-13 which are based on Reading Passage 1 below.

Save Salmon

A.

The Columbia River Basin is North America's fourth largest, draining about 250,000 square miles and extending throughout the Pacific Northwest and into Canada. There are over 250 reservoirs and around 150 hydroelectric projects in the basin, including 18 main stem dams on the Columbia and its main tributary, the Snake River. The US Army Corps of Engineers operates nine of ten major federal projects on the Columbia and Snake rivers, and Dworshak Dam on the Clearwater River, Libby Dam on the Kootenai River, and Albeni Falls Dam on the Pend Oreille River. The federal projects are a major source of power in the region, and provide flood control, navigation, recreation, fish and wildlife, municipal and industrial water supply, and irrigation benefits.

B.

The Columbia River Basin provides habitat for five species of salmon (chinook, coho, chum, sockeye and pink), steelhead, shad, smelt and lamprey. Salmon hatch in fresh water rivers and tributaries where they rear for a year or two. They then migrate to and mature in the ocean and return to their place of origin as adults to spawn. Salmon live two to five years in the ocean before returning to spawning areas. A number of factors have contributed to the decline of salmon stocks in the Columbia and Snake River Basin. Overharvesting in the late 1800s into the early 1900s, effects on habitat from farming, cattle grazing, mining, logging, road construction, and industrial pollution, and the complex of tributary and main stem dams all have had an impact. A variety of ocean conditions including currents, pollution, temperature changes, and nutrient base affect salmon survival. Dams clearly have had a significant impact, particularly those that eliminated access to fresh water habitat (preventing adult fish from returning to spawn),

and those through which fish passage is provided but at reduced levels from natural conditions.

C.

The dams impede juvenile and adult migrations to and from the ocean by their physical presence and by creating reservoirs. The reservoirs behind the dams slow water velocities, alter river temperatures, and increase predation potential. Reduced water velocity increases the time it takes juveniles to migrate downstream, higher water temperatures may have adverse effects on juvenile and adult behavior, and predators find prey more easily in slower moving water. The Corps operates a series of eight dams on the lower Columbia and Snake rivers that affect the habitat and migration of salmon. These dams are equipped with adult and juvenile fish passage facilities. Adult fish ladders at all eight lower Columbia and Snake dams were integrated into the design of the dams beginning with Bonneville in 1938. These ladders consist of a series of steps and which provide a gradual upward climb over the dams for returning adults. To steer the adults to the ladders, "attraction" flows at the downstream ladder entrances simulate conditions that would be found at the base of natural waterfalls. The concept has proved effective for adult fish passage.

D.

Currently, juvenile fish can migrate past the dams by several routes: through the turbine; through the juvenile fish bypass system; or over the dam spillway. Some fish are transported past the dams by barge and truck under the juvenile fish transportation program. At the Dalles Dam, fish are bypassed through the ice and trash sluiceway. The juvenile fish bypass systems in place at seven of the eight lower Columbia and Snake River dams guide fish away from turbines by means of submerged screens positioned in front of the turbines. The juvenile fish are directed up into a gate well, where they pass through orifices into channels that run the length of the dam. The fish are then either routed back out to the river below the dam, which is called "bypassing" or, at the four dams with fish transport facilities, fish can be routed to a holding area for loading on specially equipped barges or trucks for transport downriver. The juvenile bypass systems

guide 80 to 90 percent of steelhead salmon and 60 to 70 percent of spring/summer chinook salmon away from the turbines and upward through the bypass channel. This percentage measure is called fish guidance efficiency, and the rates vary from dam to dam. The fish guidance efficiency for fall chinook salmon is about 30 percent.

E.

Three of the four Snake River dams, and McNary Dam on the Columbia River, have fish transport facilities. At these four dams, juvenile fish that go through the bypass systems can be routed either directly back into the river below the dam, or to holding and loading facilities for loading into barges or trucks for transport. The transport barges and trucks carry the fish past the remaining projects for release below Bonneville dam. River water circulates through the barges allowing the fish to imprint the chemicals and smells of the water during the trip downriver. The barges have a closed-circuit recirculation system which can shut off water intake in case of contamination in the river. They also have pumping systems which can help de-gas the water in areas where gas super saturation is a problem.

F.

The Corps runs the Juvenile Fish Transportation Program in cooperation with National Marine Fisheries Service, and in accordance with the National Marine Fisheries Service hydropower Biological Opinion for salmon. Fifteen to 20 million salmon and steelhead have typically been transported each year over the past several years. The program has come under criticism in recent years from state and tribal fishery agencies and environmental groups, who believe that rather than putting fish in barges, efforts should concentrate on improving in-river migration conditions. Hydropower operations can be modified to improve in-river migration conditions for fish. During the juvenile fish migration seasons, from late March until fall, flows in the river are augmented, and water is spilled at the dams, to aid juvenile migration.

Questions 1— 4

Using **NO MORE THAN THREE WORDS** from the passage, answer the following questions.

1. How many rivers are mentioned in the second paragraph?
2. How many different kinds of fish are mentioned in the third paragraph?
3. How old are salmon when they return to their place of origin?
4. Apart from ocean conditions and dams, how many factors have contributed to the decline of salmon stocks?

Questions 5 — 8

Complete the summary below

Choose **NO MORE THAN THREE WORDS** from the passage for each answer.

Reservoirs slow down the rate of ___5___ increase ___6___ and encourage predators. Eight dams on the lower Columbia and Snake rivers have ___7___ to cope with these problems. Fish ladders began in ___8___ for the returning adult fish.

Questions 9 — 13

Do the following statements agree with the information given in Reading Passage 1?

In boxes 9 — 13 on your answer sheet write

YES, if the statement agrees with the writer

NO, if the statement contradicts the writer

NOT GIVEN, if there is no information about this in the passage.

9. There are now juvenile fish bypass systems at all of the lower Columbia and Snake River dams.
10. Summer is a better time than autumn for returning Chinook salmon.
11. There are more barges than trucks for juvenile fish.
12. The Juvenile Fish Transport Program has been criticized by three distinct groups lately.
13. Enlarged river flows from late March to fall can help juvenile migration.

SECTION 2

You should spend about 20 minutes on Questions 14 — 26 which are based on Reading Passage 2 below.

On the wings of a Kite

How were the pyramids built? How were obelisks erected? A new theory from a group of American amateur kite enthusiasts has provided new inroads in trying to answer this mystery.

A.

Millions of words have been written on how the pyramids and obelisks of ancient Egypt were erected. Theories put forward include a massive slave labour force, a theory which some Egyptologists still adhere to. However, most engineers know that a skilled labour force was much more advantageous, rather than a mass presence of unskilled labourers. As to the mechanism by which this skilled labour force built the pyramids and erected the obelisks? For the pyramids, a "ramp method" is proposed, even though this would mean that for the Great Pyramid, the ramp would be a mile long, and would require more material and construction effort than the building of the pyramid itself. As to the erection of obelisks, the "sandpit method" is the most adhered to theory, in which a sand hill was constructed around the site of the obelisk, with the obelisk then lowered into position.

B.

Dr Maureen Clemmons' interest in Egyptian building techniques started when she read an article in the January 1997 Smithsonian about the attempt to raise a 40-ton obelisk resting in an ancient quarry in Aswan, Egypt. The granite of Aswan was the favoured stone from which obelisks were carved. These were then transported mostly via the river Nile — further north, mostly in the region of Thebes/Luxor, which at that time formed the capital of the Egyptian Empire. Even though the obelisk was relatively light in monument terms (40 tons compared to other obelisks weighing 100-300 tons), the crew was unable

to produce the lift needed to raise the obelisk. Dr. Maureen Clemmons pondered the problem and has since offered a new possibility as to how the ancient Egyptians may have erected their obelisks: wind power, using kites. For seven years leading up to January 2004, Clemmons was the main motivator of a team of amateurs whom received little to no funding, all of them trying to show practically that obelisks could be erected by harnessing the power of the wind.

C.

It is well known that the ancient Egyptians had been successful in controlling and harvesting the power of the wind: they sailed along the Nile, which formed the artery of ancient Egypt. Furthermore, Egypt was blessed with a rather steady wind direction, coming mainly from the North West. Even though we know that the Egyptians sailed the Nile from very early times, there are few references or written records of this enterprise. Like the building of the pyramids or the obelisks, the Egyptians seemed to show no interest in committing to writing how these things were done... Clemmons wondered whether the ancient Egyptians applied their acquired knowledge of the wind on the Nile also on land. The inspiration came when Clemmons saw a building frieze in a Cairo museum, showing a wing pattern in bas-relief that did not resemble any living bird, directly below which were several men standing near vertical objects that could be ropes. Was this carving showing how the ancient Egyptians had built their monuments? Kites are known to provide pull and lift, two great forces that, if harnessed, could be great allies in their construction efforts. In the 20th century, Egyptologists have also uncovered that the ancient Egyptians were indeed aware of pulleys, a required ingredient in harnessing wind power as performed by Clemmons' team.

D.

After years of initially small tests, the first "real" test involved the erection of a 3.5 ton obelisk. The test site was at Quartz Hill in the California desert, hoping to mimic some of the Egyptian desert conditions. Tests showed that twisted hemp rope when wet could stand the comparison with modern nylon ropes. The team relied on the work of Dr Elizabeth Barber, a linen expert, and Rod Thrall, a kite builder from Oregon to transform

the test site into a working Egyptian model. The first successful test occurred on April 14, 2001. In wind speed of approximately 15 mph, the obelisk was raised in approximately one hour. On June 23, 2001, the team raised the 3 m-tall obelisk into vertical position in 22 mph winds in under 25 seconds. At the end, the obelisk was seen to be swinging from the top of its lifting frame, like a giant pendulum. It seemed to be that easy...The team now knew that the best operating conditions were steady winds, between 20-25 mph. In January 2004, working in optimal wind conditions, the obelisk raised itself to ten feet after 27 minutes. An angle of 80 to 85 degrees was reached after 57 minutes. The test proved a success as it showed that a single kite was able to provide sufficient lift to raise an obelisk. Though the team focused on the erection of obelisks, the "pyramid building" scheme was not neglected. In 2003, the team showed how two ton stones easily moved on rollers, propelled by the powers of the wind via a kite. The system also allowed stones to be lifted up a ramp.

E.

With initial success of showing that wind power can be harnessed and used in the building industry, Egyptologists have nevertheless pointed out that Clemmons has only shown a possible technique — but that this does not mean that the ancient Egyptians followed this technique. This in itself is true, but what Egyptologists fail to add is that their preferred explanations equally fall short of that criterion. What makes Clemmons' approach specifically of interest over the cherished explanations — is the speed in which these complex tasks are performed. Mass labour and massive ramps could indeed — possibly — build the Great Pyramid. But if this pyramid was built in approximately twenty years, as Egyptologists argue, then it means that one stone was lifted into place approximately every two seconds (under normal working conditions). In the ramp theory, this seems hardly plausible. However, in the wind power theory, we see how fast this process can be. Furthermore, the "wind method" requires far less ancillary work to be carried out than the "ramp method". In the "sandpit method; weeks would be spent constructing the sand hill and lowering the obelisk in place. In the "wind method" , a mobile if not reusable lifting frame might require a few hours or days to be put into place, with the obelisk lifted in a matter of hours.

F.

Clemmons' method has one final advantage; the bodies of the slave labour force have not been found; the remains of the giant ramps around the pyramids has equally not been found. There are, in short, no archaeological traces of a method that should have left traces. But the "wind method" would not leave such traces — and would also be a quick to clean up method once the work is completed.

Questions 14 —18

Reading Passage 2 has 6 paragraphs A— F.

From the list of headings below choose the most suitable headings for paragraphs A— E.

Write the appropriate numbers (i — x).

NB There are more headings than paragraphs so you will not use all of them.

List of Headings

- i. Wind is stronger than man
- ii. Aswan granite and obelisk
- iii. Early theories of how to build pyramids
- iv. An amateur group and a novel idea
- v. Popular but not perfect explanations
- vi. Favourable conditions of harvesting the wind
- vii. The inspiration came from museum
- viii. Small tests of wind power
- ix. The feasibility of the theories was proved
- x. More advanced theories

14. Paragraph A
15. Paragraph B
16. Paragraph C
17. Paragraph D
18. Paragraph E

Questions 19 — 26

Do the following statements agree with the information given in Reading Passage 2?

In boxes 19 — 26 on your answer sheet write

YES, if the statement agrees with the writer

NO, if the statement contradicts the writer

NOT GIVEN, if there is no information about this in the passage.

19. Unlike scientists most Egyptian experts believe that the pyramids were built by a massive force of unskilled labour.

20. The Smithsonian attempt in 1997 failed to erect an obelisk.

21. Unfortunately all early written records of pyramids and obelisks were lost in the Nile.

22. In January 2004 Clemmons saw a carving in Cairo which gave her the clue she needed.

23. The first real test on April 14, 2001 was successful using a team of three.

24. After proving that a single kite could lift an obelisk the team switched its attention to pyramid building.

25. Clemmons theory ultimately failed compared to the other theories because it could not be proved that the Egyptians used wind power.

26. If the three methods mentioned only the ramp method would leave no traces.

SECTION 3

You should spend about 20 minutes on Questions 27 — 40 which are based on Reading Passage 3 below.

A Weighty Issue

A.

According to a report produced by the British Medical Association (BMA), the state of adolescent health in the UK is in a poor condition. A key problem is obesity, which is thought to be caused by a poor diet with too many high-fat, high-calorie foods, along with a lack of exercise. In fact, the report claims that excess body weight is now the most common childhood disorder in Europe, and a staggering one in five youngsters aged 13 to 16 are overweight and nearly one in five 15-year-olds are obese. 'The figures are worrying as being obese can cause both immediate and future serious health problems. These include the risk of high blood pressure, heart disease and type 2 diabetes. It's also the most important dietary factor in cancer', said a spokesperson for the British Nutrition Foundation (BNF), and can cause complications during and after pregnancy.

B.

Type 2 diabetes used to only affect middle-aged but in recent years have been detected in teens as young as 13-years-old for the first time. This, in itself, is believed to be another direct factor linked to the rising levels of obesity. And children affected by obesity are likely to have a shorter lifespan than their parents. As well as physical illness and disease, being obese or overweight can cause a range of psychological problems too. The BMA report highlighted that it can significantly affect wellbeing, with many adolescents developing a negative self image and experiencing low self- 'esteem'. It can also lead to eating diseases, bullying, depression, and feelings of loneliness and nervousness.

C.

Doctors use a measurement system called the body mass index (BMI) to assess whether people are a healthy weight, overweight or obese. It's worked out by dividing a person's

weight in kilograms by their height in metres squared. For example, if you are 1.7 metres tall and weigh 68 kilos, your BMI would be 23.5 (68 divided by 1.7 x 1.7), which falls into the desirable or healthy range. According to the BMI chart, adults (over 18s) are overweight if they have a BMI of between 25 and 30, and they're obese if it's 30 or over.

Body Mass Index (BMI) guide for people aged 18 and over

BMI (kg/m²)	
Less than 20	Underweight
Over 20 to 25	Desirable or healthy range
Over 25 to 30	Overweight
Over 30 to 35	Obese (class I)
Over 35 to 40	Obese (class II)
Over 40	Severely obese (class III)

D.

A similar method is used for children, but instead it has a sliding scale linked to age. As well as BMI levels, the areas where the fat is deposited in the body is important, too, explained a spokesperson for the BNF. 'People who have extra fat around their middle, a body we call apple shaped, are at a greater risk of some diseases than those who have most of the extra weight around their hips and thighs, or are pear shaped.' When it comes to preventing and treating excess weight and obesity, experts believe a healthy balanced diet and regular exercise are crucial. The key to maintaining a good weight is to balance your energy intake and output, as weight is gained if you regularly eat more than you burn off.

E.

Obese children may require a specially developed programme, which is likely to focus on healthy eating, exercise and social support. In the case of children, it's beneficial for the whole family to adopt healthier behaviours and it's important not to single out a child. Likewise, the Royal College of Paediatrics suggests parents should be actively involved in helping children manage their weight, and says obesity problems should be dealt with slowly, by making gradual changes to eating habits and physical activity. Increasingly inactive lifestyles and couch-potato tendencies, for example watching television and playing computer games, are thought to be contributors to obesity, so being more active is very helpful. The minimum recommended level of activity is at least 30 minutes of moderate-intensity activity, five days a week. Moderate intensity means a state in which your breathing and heart rate are faster than normal.

F.

Siobhan Weir, physical activity programme manager at the Health Protection Agency said, 'Getting people to take some moderate activity as opposed to being sedentary is likely to have the greatest beneficial effect on their health.' A good form of exercise for those who have been leading fairly inactive lives — and one that's free — is walking, she says. 'Research shows that walking a mile briskly uses the same energy as running a mile and regular physical activity can reduce weight by as much as one stone in three months. To really reap the benefits, aim to walk briskly so that you are feeling warmer

and slightly out of breath.' If walking isn't for you, there's a whole range of other activities available, from team sports such as football, hockey or basketball, classes such as aerobics or sessions at the gym, to alternatives such as martial arts, yoga or tai chi. The key is to find something you enjoy and stick to it. It's easy to put off healthy eating habits and exercise, but the sooner we start, the better the outcome for our health. By starting at a young age, the chances are good habits will continue into the future too.

Questions 27 — 30

Choose the appropriate letters A —D and write them in boxes 27 — 30 on your answer sheet.

27. A report by the BMA states that nearly 40% of 15-year-olds are

- A. overweight.
- B. obese.
- C. overweight or obese.
- D. none of the above.

28. According to the BMA and BNF being obese can lead to at least different kinds of health

problems

- A. 4
- B. 5
- C. 6
- D. 7

29. According to paragraphs 2 and 3 type 2 diabetes

- A. is only a cause of obesity.
- B. is both a cause and effect of obesity.
- C. is only an effect of obesity.
- D. is none of the above

30. The BMA report mentions psychological problems.

- A. 2
- B. 3
- C. 7
- D. 8

Questions 31 — 35

Complete the summary below Choose NO MORE THAN THREE WORDS from the passage for each answer.

Body Mass Index (BMI) assesses whether adults are below, within or above a ___31 using weight and height as measurements. For children a ___32___ related to age is included. People who are ___33___ shaped are less at risk than those who are ___34___ shaped. It is believed that a ___35___ energy intake and output is the key to maintaining a good weight.

Questions 36— 40

Complete the sentence below (Questions 36 — 40) with word taken from Reading Passage 3.

Use **NO MORE THAN THREE WORDS** for each answer.

Write your answers in boxes 36 — 40 on your answer sheet.

- 36. Obese children need social support which usually comes from_____.
- 37. At least_____of exercise is recommended every week.
- 38. If a person is said to be sedentary they have_____.
- 39. Research shows that_____can lose weight over a short period of time.
- 40. Adults are_____if they have a BMI of 30.

Reading Test 23

SECTION 1

You should spend about 20 minutes on Questions 1 -11 which are based on Reading Passage 1

THE SPECTACULAR ERUPTION OF MOUNT ST. HELENS

A. The eruption in May 1980 of Mount St. Helens, Washington State, astounded the world with its violence. A gigantic explosion tore much of the volcano's summit to fragments; the energy released was equal to that of 500 of the nuclear bombs that destroyed Hiroshima in 1945.

B. The event occurred along the boundary of two of the moving plates that make up the Earth's crust. They meet at the junction of the North American continent and the Pacific Ocean. One edge of the continental North American plate overrides the oceanic Juan de Fuca microplate, producing the volcanic Cascade range that includes Mounts Baker, Rainier and Hood, and Lassen Peak as well as Mount St. Helens.

C. Until Mount St. Helens began to stir, only Mount Baker and Lassen Peak had shown signs of life during the 20th century. According to geological evidence found by the United States Geological Survey, there had been two major eruptions of Mount St. Helens in the recent (geologically speaking) past: around 1900 B. C., and about A.D. 1500. Since the arrival of Europeans in the region, it had experienced a single period of spasmodic activity, between 1831 and 1857. Then, for more than a century, Mount St. Helens lay dormant.

D. By 1979, the Geological Survey alerted by signs of renewed activity, had been monitoring the volcano for 18 months. It warned the local population against being deceived by the mountain's outward calm and forecast that an eruption would take place before the end of the century. The inhabitants of the area did not have to wait that long. On March 27, 1980, a few clouds of smoke formed above the summit, and slight tremors were felt. On the 28th, larger and darker clouds consisting of gas and ashes emerged

and climbed as high as 20,000 feet. In April a slight lull ensued, but the volcanologists remained pessimistic. Then, in early May, the northern flank of the mountain bulged, and the summit rose by 500 feet.

E. Steps were taken to evacuate the population. Most - campers, hikers, timber - cutters - left the slopes of the mountain. Eighty-four-year-old Harry Truman, a holiday lodge owner who had lived there for more than 50 years, refused to be evacuated, in spite of official and private urging. Many members of the public, including an entire class of school children, wrote to him, begging him to leave. He never did.

F. On May 18, at 8. 32 in the morning, Mount St. Helens blew its top, literally. Suddenly, it was 1,300 feet shorter than it had been before its growth had begun. Over half a cubic mile of rock had disintegrated. At the same moment, an earthquake with an intensity of 5 on the Richter scale was recorded. It triggered an avalanche of snow and ice, mixed with hot rock - the entire north face of the mountain had fallen away. A wave of scorching volcanic gas and rock fragments shot horizontally from the volcano's riven flank, at an inescapable 200 miles per hour. As the sliding ice and snow melted, it touched off devastating torrents of mud and debris, which destroyed all life in their path. Pulverized rock climbed as a dust cloud into the atmosphere. Finally, viscous lava, accompanied by burning clouds of ash and gas, welled out of the volcano's new crater, and from lesser vents and cracks in its flanks.

G. Afterwards, scientists were able to analyse the sequence of events. First, magma - molten rock - at temperatures above 2000 °F, had surged into the volcano from the Earth's mantle. The build-up was accompanied by an accumulation of gas, which increased as the mass of magma grew. It was the pressure inside the mountain that made it swell. Next, the rise in gas pressure caused a violent decompression, which ejected the shattered summit like a cork from a shaken soda bottle. With the summit gone, the molten rock within was released in a jet of gas and fragmented magma, and lava welled from the crater.

H. The effects of Mount St. Helens eruption were catastrophic. Almost all the trees of the surrounding forest, mainly Douglas firs, were flattened, and their branches and bark ripped off by the shock wave of the explosion. Ash and mud spread over nearly 200 square miles of country. All the towns and settlements in the area were smothered in an even coating of ash. Volcanic ash sifted up the Columbia River 35 miles away, reducing the depth of its navigable channel from 40 feet to 14 feet, and trapping sea-going ships. The debris that accumulated at the foot of the volcano reached a depth, in places, of 200 feet.

I. The eruption of Mount St. Helens was one of the most closely observed and analysed in history. Because geologists had been expecting the event, they were able to amass vast amounts of technical data when it happened. Study of atmospheric particles formed as a result of the explosion showed that droplets of sulphuric acid, acting as a screen between the Sun and the Earth's surface, caused a distinct drop in temperature. There is no doubt that the activity of Mount St. Helens and other volcanoes since 1980 has influenced our climate. Even so, it has been calculated that the quantity of dust ejected by Mount St. Helens - a quarter of a cubic mile - was negligible in comparison with that thrown out by earlier eruptions, such that of Mount Katmai in Alaska in 1912 (three cubic miles). The volcano is still active. Lava domes have formed inside the new crater, and have periodically burst. The threat of Mount St. Helens lives on.

Questions 1 -2

Reading Passage 1 has 9 paragraphs labelled A-I. Answer questions 1 and 2 by writing the appropriate letters A-I in boxes 1 and 2 on your answer sheet.

1. Which paragraph describes the evacuation of the mountain?
2. Which paragraph describes the moment of the explosion of Mount St. Helens?

Questions 3 -4

3. What are the dates of the TWO major eruptions of Mount St. Helens before 1980?

Write TWO dates in box 3 on your answer sheet

4. How do scientists know that the volcano exploded around the two dates above?

Using NO MORE THAN THREE WORDS. write your answer in box 4 on your answer sheet.

Questions 5 -8

Complete the summary of events below leading up to the eruption of Mount St. Helens. Choose NO MORE THAN THREE WORDS from the passage for each answer. Write your answers in boxes 5 -8 on your answer sheet.

In 1979 the Geological Survey warned ___5___ to expect a violent eruption before the end of the century. The forecast was soon proved accurate. At the end of March, there were tremors and clouds formed above the mountain. This was followed by a lull, but in early May the mountain rose by ___6___. People were ___7___ from around the mountain. Finally, on May 18th at ___8___, Mount St. Helens exploded.

Questions 9 -10

Complete the table below giving evidence for the power of the Mount St. Helens eruption.

Write your answers in boxes 9 and 10 on your answer sheet.

ITEM	EQUIVALENT TO
Example The energy released by the explosion of Mount St. Helens	Answer 500 nuclear bombs
The area of land covered in mud or ash	9 _____
The quantity of dust ejected	10 _____

Question 11

Choose the appropriate letter A-D and write it in box 11 on your answer sheet.

11. According to the text, the eruption of Mount St. Helens and other volcanoes has influenced our climate by _____

- A. increasing the amount of rainfall.
- B. heating the atmosphere.
- C. cooling the air temperature.
- D. causing atmospheric storms.

SECTION 2

You should spend about 20 minutes on Questions 12 -25 which are based on Reading Passage 2.

PEOPLE AND ORGANIZATIONS: THE SELECTION ISSUE

A. In 1991, according to the Department of Trade and Industry, a record 48,000 British companies went out of business. When businesses fail, the post-mortem analysis is traditionally undertaken by accountants and market strategists. Unarguably organizations do fail because of undercapitalization, poor financial management, adverse market conditions etc. Yet, conversely, organizations with sound financial backing, good product ideas and market acumen often underperform and fail to meet shareholders' expectations. The complexity, degree and sustainment of organizational performance requires an explanation which goes beyond the balance sheet and the "paper conversion" of financial inputs into profit-making outputs. A more complete explanation of "what went wrong" necessarily must consider the essence of what an organization actually is and that one of the financial inputs, the most important and often the most expensive, is people.

B. An organization is only as good as the people it employs. Selecting the right person for the job involves more than identifying the essential or desirable range of skills, educational and professional qualifications necessary to perform the job and then recruiting the candidate who is most likely to possess these skills or at least is perceived to have the ability and predisposition to acquire them. This is a purely person/skills match approach to selection.

C. Work invariably takes place in the presence and/or under the direction of others, in a particular organizational setting. The individual has to "fit" in with the work environment, with other employees, with the organizational climate, style of work, organization and culture of the organization. Different organizations have different cultures (Cartwright &

Cooper, 1991;1992). Working as an engineer at British Aerospace will not necessarily be a similar experience to working in the same capacity at GEC or Plessey.

D. Poor selection decisions are expensive. For example, the costs of training a policeman are about £ 20,000 (approx. US \$30,000). The costs of employing an unsuitable technician on an oil rig or in a nuclear plant could, in an emergency, result in millions of pounds of damage or loss of life. The disharmony of a poor person-environment fit (PE-fit) is likely to result in low job satisfaction, lack of organizational commitment and employee stress, which affect organizational outcomes i. e., productivity, high labour turnover and absenteeism, and individual outcomes i.e, physical, psychological and mental well-being.

E. However, despite the importance of the recruitment decision and the range of sophisticated and more objective selection techniques available, including the use of psychometric tests, assessment centres etc. , many organizations are still prepared to make this decision on the basis of a single 30 to 45-minute unstructured interview. Indeed, research has demonstrated that a selection decision is often made within the first four minutes of the interview. In the remaining time, the interviewer then attends exclusively to information that reinforces the initial accept or "reject" decision. Research into the validity of selection methods has consistently demonstrated that the unstructured interview, where the interviewer asks any questions he or she likes, is a poor predictor of future job performance and fares little better than more controversial methods like graphology and astrology. In times of high unemployment, recruitment becomes a "buyer's market" and this was the case in Britain during the 1980s.

F. The future, we are told, is likely to be different. Detailed surveys of social and economic trends in the European Community show that Europe's population is falling and getting older. The birth rate in the Community is now only threequarters of the level needed to ensure the replacement of the existing population. By the year 2020, it is predicted that more than one in four Europeans will be aged 60 or more and barely one in five will be under 20. In a five-year period between 1983 and 1988, the Community's female

workforce grew by almost six million. As a result, 51 % of all women aged 14 to 64 are now economically active in the labour market compared with 78% of men.

G. The changing demographics will not only affect selection ratios. They will also make it increasingly important for organizations wishing to maintain their competitive edge to be more responsive and accommodating to the changing needs of their workforce if they are to retain and develop their human resources. More flexible working hours, the opportunity to work from home or job share, the provision of childcare facilities etc. , will play a major role in attracting and retaining staff in the future.

Questions 12 -16

Reading Passage 2 has seven paragraphs A-G.

Choose the most suitable headings for paragraphs B-E and G from the list of headings below.

Write the appropriate numbers (i-x) in boxes 12 -16 on your answer sheet.

NB There are more headings than paragraphs so you will not use all of them. You may use any of the headings more than once.

List of Headings

- i The effect of changing demographics on organizations.
- ii Future changes in the European workforce.
- iii The unstructured interview and its validity.
- iv The person-skills match approach to selection.
- v The implications of a poor person-environment fit.
- vi Some poor selection decisions.
- Vii The validity of selection procedures.
- viii The person-environment fit.
- ix Past and future demographic changes in Europe.
- x Adequate and inadequate explanations of organizational failure.

- 12. Paragraph B
- 13. Paragraph C
- 14. Paragraph D
- 15. Paragraph E
- 16. Paragraph G

Questions 17 —22

Do the following statements agree with the views of the writer in Reading Passage 2? In boxes 17 —22 on your answer sheet write

- YES, if the statement agrees with the writer
- NO, if the statement does not agree with the writer
- NOT GIVEN, if there is no information about this in the passage

- 17. Organizations should recognize that their employees are a significant part of their financial assets.
- 18. Open-structured 45 minute interviews are the best method to identify suitable employees.
- 19. The rise in the female workforce in the European Community is a positive trend.
- 20. Graphology is a good predictor of future job performance.
- 21. In the future, the number of people in employable age groups will decline.
- 22. In 2020, the percentage of the population under 20 will be smaller than now.

Questions 23 -25

Complete the notes below with words taken from Reading Passage 2. Use NO MORE THAN ONE or TWO WORDS for each answer. Write your answers in boxes 23 —25 on your answer sheet.

Poor person-environment fit	
7. Low job satisfaction	
8. Lack of organizational commitment	
9. Employee stress	
↓	
_____ 23 _____	_____ 24 _____
a. low production rates	a. Poor health
b. high rates of staff change	b. poor psychological health
c. _____ 25 _____	c. poor mental health

SECTION 3

You should spend about 20 minutes on Questions 26 —38 which are based on Reading Passage 3.

THE ROLL-FILM REVOLUTION

A. The introduction of the dry plate process brought with it many advantages. Not only was it much more convenient, so that the photographer no longer needed to prepare his material in advance, but it's much greater sensitivity made possible a new generation of cameras. Instantaneous exposures had been possible before, but only with some difficulty and with special equipment and conditions. Now, exposures short enough to permit the camera to be held in the hand were easily achieved. As well as fitting shutters and viewfinders to their conventional stand cameras, manufacturers began to construct smaller cameras intended specifically for hand use.

B. One of the first designs to be published was Thomas Bolas' s 'Detective' camera of 1881. Externally a plain box, quite unlike the folding bellows camera typical of the period, it could be used unobtrusively. The name caught on, and for the next decade or so almost all hand cameras were called 'Detectives'. Many of the new designs in the 1880s were for magazine cameras, in which a number of dry plates could be pre-loaded and changed one after another following exposure. Although much more convenient than stand cameras, still used by most serious workers, magazine plate cameras were heavy, and required access to a darkroom for loading and processing the plates. This was all changed by a young American bank clerk turned photographic manufacturer, George Eastman, from Rochester. New York.

C. Eastman had begun to manufacture gelatine dry plates in 1880, being one of the first to do so in America. He soon looked for ways of simplifying photography, believing that many people were put off by the complication and messiness. His first step was to develop, with the camera manufacturer William H. Walker, a holder for a long roll of paper negative 'film'. This could be fitted to a standard plate camera and up to forty-eight exposures made before reloading. The combined weight of the paper roll and the holder

was far less than the same number of glass plates in their light-tight wooden holders. Although roll-holders had been made as early as the 1850s, none had been very successful because of the limitations of the photographic materials then available. Eastman's rollable materials then available. Eastman's rollable paper film was sensitive and gave negatives of good quality; the Eastman — Walker roll-holder was a great success.

D. The next step was to combine the roll-holder with a small hand camera: Eastman's first design was patented with an employer, F. M. Cossitt, in 1886. It was not a success. Only fifty Eastman detective cameras were made, and they were sold as a lot to a dealer in 1887; the cost was too high and the design too complicated. Eastman set about developing a new model, which was launched in June 1888. It was a small box, containing a roll of Paper-based stripping box, containing a roll of Paper-based stripping film sufficient for 100 circular exposures 6 cm in diameter. Its operation was simple; set the shutter by pulling a wire string; aim the camera using the V line impression in the camera top; press the release button to activate the exposure, and turn a special key to wind on the film. A hundred exposures had to be made, so it was important to record each picture in the memorandum book provided since there was no exposure counter. Eastman gave his camera the invented name 'Kodak' — which was easily pronounceable in most languages and had two Ks which Eastman felt was a firm, uncompromising kind of letter.

E. The importance of Eastman's new roll-film camera was not that it was the first. There had been several earlier cameras, notably the Stirn 'America', first demonstrated in the spring of 1887 and on sale from early 1888. This also used a roll of negative paper and had such refinements as a reflecting viewfinder and an ingenious exposure marker. The real significance of the first Kodak camera was that it was backed up by a developing and printing service. Hitherto, virtually all photographers developed and printed their own pictures. This required the facilities of a darkroom and the time and inclination to handle the necessary time and inclination to handle the necessary chemicals, make the prints and so on. Eastman recognized that not everyone had the resources or the desire to do this. When a customer had made a hundred exposures in the Kodak camera, he sent it

to Eastman's factory in Rochester (or later in Harrow in England) where the film was unloaded, processed and printed, the camera reloaded and returned to the owner.

F. "You Press the Button, We Do the Rest" ran Eastman's classic marketing slogan; photography had been brought to everyone. Everyone, that is, who could afford \$25 or five guineas for the camera and \$10 or two guineas for the developing and printing. A guinea (\$5) was a week's wages for many at the time, so this simple camera cost the equivalent of hundreds of dollars today. In 1889 an improved model with a new shutter design was introduced, and it was called the No. 2 Kodak camera. The paper-based stripping film was complicated to manipulate since the processed negative image had to be stripped from the paper base for printing. At the end of 1889 Eastman launched a new roll film on a celluloid base.

G. Clear, tough, transparent and flexible, the new Clear, tough, transparent and flexible, the new film not only made the roll film camera fully practical but provided the raw material for the introduction of cinematography a few years later. Other, larger models were introduced, including several folding versions, one of which took pictures 21.6 cm x 16.5 cm in size. Other manufacturers in America and Europe introduced cameras to take the Kodak roll-films, and other firms began to offer developing and printing services for the benefit of the new breed of photographers. By September 1889, over 5,000 Kodak cameras had been sold in the USA, and the company was daily printing 6 -7,000 negatives. Holidays and special events created enormous surges in demand for processing: 900 Kodak users returned their cameras for Kodak users returned their cameras for processing and reloading in the week after the New York centennial celebration.

Questions 26 -29

Do the following statements agree with the views of the writer in Reading Passage 3? In boxes 26 -29 on your answer sheet write,

YES, if the statement agrees with the writer

NO, if the statement does not agree with the writer

NOT GIVEN, if there is no information about this in the passage

- 26. Before the dry plate process, short exposures could only be achieved with cameras held in the hand.
- 27. Stirn's 'America' camera lacked Kodak's developing service.
- 28. The first Kodak film cost the equivalent of a week's wages to develop.
- 29. Some of Eastman's 1891 range of cameras could be loaded in daylight.

Questions 30-34

Choose **NO MORE THAN THREE WORDS** from the passage for each answer. Write your answers in boxes 30 -34 on your answer sheet.

Complete the diagram below.

Questions 35 —38

Choose **NO MORE THAN THREE WORDS** from the passage for each answer. Write your answers in boxes 35 -38 on your answer sheet.

Complete the table below.

YEAR	DEVELOPMENTS	NAME OF PERSON /PEOPLE
1880	Manufacture of gelatine dry plates	___35___
1881	Release of 'Detective' camera	Thomas Bolas
___36___	The roll-holder combined with ___37___	Eastman and F. M. Cossitt
1889	Introduction of model with ___38___	Eastman

Reading Test 24

SECTION 1

You should spend about 20 minutes on Questions 1-13 which are based on Reading Passage 1 below.

Aswan High Dam

A. Just north of the border between Egypt and Sudan lies the Aswan High Dam, a huge rockfill dam which captures the world's longest river, the Nile, in one of the world's third-largest reservoirs, Lake Nasser. The dam, known as Saad el Aali in Arabic, was completed in 1970 after 18 years of work. Egypt has always depended on the water of the Nile River. The two main tributaries of the Nile River are the White Nile and the Blue Nile. Lake Victoria is the source of the r White Nile and the Blue Nile begins in the Ethiopian Highlands. The two tributaries converge in Khartoum, the capital of Sudan where they form the Nile River. The Nile River has a total length of 4,160 miles (6,695 kilometres) from source to the Mediterranean Sea.

B. Before the building of a dam at Aswan, Egypt experienced annual floods from the Nile River which deposited 4 million tons of nutrient-rich sediment which enabled agricultural production. This process began millions of years valley and continued until the first darn at Aswan was built in 1889. This dam was insufficient to hold back the water of the Nile and was subsequently raised in 1912 and 1933. In 1946, the true danger was revealed when the water in the reservoir peaked near the top of the dam.

C. In 1952, the interim Revolutionary Council government of Egypt decided to build a High Dam at Aswan, about four miles upstream of the old dam. In 1954, Egypt requested loans from the World Bank to help pay for the cost of the dam (which eventually added up to US \$1 a billion). Initially, the United States agreed to loan Egypt money but then withdrew their offer for unknown reasons. Some speculate that it may have been due to Egyptian and Israeli conflict. The United Kingdom, France, and Israel had invaded Egypt in 1956, soon after Egypt nationalized the Suez Canal to help pay for the dam. The former Soviet Union offered to help and Egypt accepted. The support was not unconditional,

however. Along with the money, they also sent military advisers and other workers to help enhance Egyptian-Soviet ties and relations.

D. In order to build the dam, both people and artefacts had to be moved. Over 90,000 Nubians had to be relocated. Those who had been living in Egypt were moved about 28 miles (45 km) away but the Sudanese Nubians were relocated 370 miles (600 km) from their homes. The government was also forced to develop one of the largest Abu Simel temples and dig for artefacts before the future lake would drown the land of the Nubians. After years of construction (the material in the dam is the equivalent to 17 of the great pyramids at Giza), the resulting reservoir was named for the former president of Egypt, Gamal Abdel Nasser, who died in 1970. The lake holds 137 million acre-feet of water (169 billion cubic metres). About 17percent of the lake is in Sudan and the two countries have an agreement for distribution of the water.

E. The dam benefits Egypt by controlling the annual floods on the Nile River and prevents the damage which used to occur along the floodplain. The Aswan High Dam provides about half of Egypt's power supply and has improved navigation along the river by keeping the water flow consistent. There are several problems associated with the dam as well. Seepage and evaporation accounts for a loss of about 12%-14% of the annual input into the reservoir. The sediments of the Nile River, as with all river and dam systems, has been filling the reservoir and thus decreasing its storage capacity. This has also resulted in problems downstream.

F. Farmers have been forced to use about a million tons of artificial fertilizer as a substitute for the nutrients which no longer fill the flood plain. Further downstream, the Nile delta is having problems due to the lack of sediment as well since there is no additional agglomeration of sediment to keep erosion of the delta at bay so it slowly shrinks. Even the shrimp caught in the Mediterranean Sea has decreased due to the change in water flow. Poor drainage of the newly irrigated lands has led to saturation and increased salinity. Over one half of Egypt's farmland is now rated medium to poor soils.

G. The parasitic disease schistosomiasis has been associated with the stagnant water of the fields and the reservoir. Some studies indicate that the number of individuals

affected has increased since the opening of the Aswan High Dam. The Nile River and now the Aswan High Dam is Egypt's lifeline. About 95% of Egypt's population lives within twelve miles from the river. Were it not for the river and its sediment, the grand civilization of ancient Egypt probably would have never existed.

Questions 1 -4

Do the following statements agree with the information given in Reading Passage 1? In boxes 1 - 4 on your answer sheet write:

YES, if the statement agrees with the writer
 NO, If the statement contradicts the writer
 NOT GIVEN, if there is no information about this in the passage.

1. The Nile River runs from Khartoum to the Mediterranean Sea.
2. The annual floods devastate agricultural production.
3. The Aswan Dam was rebuilt twice.
4. The former Soviet Union helped Egypt during the 1956 war.

Questions 5 -8

Choose **NO MORE THAN THREE WORDS OR A NUMBER** from the passage for each answer.

Complete the table below.

<u>Number</u>	<u>Name</u>
28 miles	___7___
Length in miles ___5___	Nile River
Relocated in miles ___6___	Sudanese Nubians
17	___8___

Questions 9 -13

Choose **NO MORE THAN THREE WORDS** from the passage for each answer.

Complete the summary below.

Benefits of the dam include less flooding and providing about 50% of ___9___. But there are many problems such as water leakage and ___10___. The Nile River has been filling

up with ___11___ and so reducing its ___12___. The Nile delta is slowly disappearing because of the lack of ___13___ of sediments.

SECTION 2

You should spend about 20 minutes on Questions 14 — 26 which are based on Reading Passage 2 below.

KOALA

A. Many people love the cute koala bear. This animal has been made into stuffed toys all over the world. But it is rare to see this creature alive and moving because it's gradually becoming extinct. The koala, like the kangaroo, is actually a marsupial. It contains a small pouch for its young. For this reason, the koala is not related to true bears. In appearance, it is a combination of a monkey and a kangaroo. Koalas are native of a monkey and a kangaroo. Koalas are native to Australia, although they are now chiefly found in New South Wales and Queensland. The koala has been hunted since the middle of the 20th century for fur and food. Today, anyone found harming a koala is severely punished by law.

B. Koalas get their endearing appearance from a covering of grey fur and little tufts of white hair on the sides of their faces. Their eyes are small and black, set in their head. They have large ears and curved noses, but no tail. They use their arms and paws to climb through the trees. Koalas have interesting living habits. They are nocturnal, which means that they move around chiefly at night. Koalas do not stay on the ground. They move from tree to tree, carefully lowering and raising themselves by their paws. Koalas have a surprisingly long life span, which can range from 9 to 20 years, in rare cases.

C. The Koala is the only mammal, other than the Greater Glider and Ringtail Possum, which can survive on a diet of eucalyptus leaves. Eucalyptus leaves are very fibrous and low in nutrition, and to most animals are extremely poisonous. To cope with such a diet, nature has equipped koalas with specialised adaptations. A very slow metabolic rate allows koalas to retain food within their digestive system for a relatively long period of time, maximising the amount of energy able to be extracted. At the same time, this slow metabolic rate minimises energy requirements. Koalas also sleep somewhere between 18 and 22 hours each day in order to conserve energy. Koalas eat only the leaves of the

eucalyptus, which is another reason that they are now becoming extinct. The eucalyptus tree is disappearing from their natural habitats, fighting a battle against extinction all its own.

D. The koala's worst enemy, besides hunters, is fire. When a tree is inflamed, often they cannot run fast enough to save themselves. Baby koalas are in danger around certain kinds of lizards and eagles, although they are protected today by natural habitats set up for them. It is interesting to note that many koalas die from being hit by cars, and some are even attacked by dogs! Their main form of defence is climbing, but they sometimes try to use their paws. Koalas raise their young in a special way. A cub is usually about one inch at birth, where it lays in the mother's pouch. It will stay in the pouch for a little over half a year, during which time the mother carries and feeds the baby. At seven weeks, a tiny koala has a head larger than its body, of about 26 millimetres. By 22 weeks, the baby begins to turn in the pouch and kick, occasionally looking out into the natural world. By 24 weeks, the cub is fully covered with fur and brain development is complete.

E. Teeth are fully formed. At thirty weeks, the cubs climb in and out of the pouch, clinging to the mother's belly in agreeable weather. From 37 weeks onward, the baby is independent of the mother, although it will rarely move more than a metre away from her in its first few weeks. Baby koalas are strongly protected by their mothers, and the familial bond is very strong in the koala world. One can tell if a baby is separated from its mother by tiny squeaks of panic. Because koala bears are so cute and rare, they are often found in zoos, where their natural environment can be maintained. Although they only wake at night, sometimes it is possible to see them moving around at twilight and early morning. During the day, they mainly sleep in trees, but they are fun to watch, nonetheless. Koalas are in grave danger because of three main threats. Their source of food is depleting, because the eucalyptus is susceptible to loggers, pharmacists and changing weather. The koala's body chemistry is also delicate, and it is extremely susceptible to diseases and bacteria not native to its environment.

F. Finally, a certain strain of venereal disease is killing off many Australian koalas, causing deformity at birth and short life spans. The largest force to contribute to koala

extinction has been hunting. Koala furs are luxurious and warm, and at one point they were in demand all over the world. In 1924, at least 2.1 million skins were exported from Australia alone! Forest clearance has also depleted the numbers of the koala, and forest fires killed off thousands, especially in the years between 1950 and 1970. Now their greatest enemy is chlamydia, a disease that can also be found in humans. This disease is transmitted by sexual contact, and it has killed over three thousand koalas in the last year. The war to save koalas has been effective. Their numbers have increased slightly, and actions have been taken to curb contact that will spread venereal deformity. In the next few years, their numbers may rise again, bringing them safely out of the danger zone.

Questions 14 —17

Choose the appropriate letters A — D and write them in boxes 14 —17 on your answer sheet.

14. Animals that have a small pouch included.

- A. koalas and bears.
- B. kangaroos and bears.
- C. monkeys and kangaroos.
- D. kangaroos and koalas.

15. Koalas are often seen actively

- A. climbing trees.
- B. on the ground.
- C. during the day.
- D. at night.

16. Eucalyptus leaves are

- A. extremely poisonous to all mammals.
- B. only eaten by koalas.
- C. getting rarer and rarer.
- D. low in fibre.

17. Koalas can only stay awake for

- A. 18 hours a day.
- B. between 18 and 22 hours a week.
- C. between 2 and 6 hours a week.
- D. between 2 and 6 hours a day.

Questions 18 — 22

Do the following statements agree with the information given in Reading Passage 2? In boxes 18 — 22 on your answer sheet write:

YES, if the statement agrees with the writer

NO, if the statement contradicts the writer

NOT GIVEN, if there is no information about this in the passage this in the passage.

18. Koalas two main foes are fire and cars.
19. After a koala's brain is fully developed it emerges outside its pouch.
20. Koalas were hunted only because their furs are luxurious and warm.
21. To save koala people have to save the eucalyptus.
22. After nine months a baby koala does not need its mother.

Questions 23 — 26

Complete the sentence below (Questions 23 — 26) with the word taken from Reading Passage 2. Use NO MORE THAN THREE WORDS for each answer. Write the answers in boxes 23 — 26 on your answer sheet.

23. It is amusing to watch koalas_____.
24. People who cut down eucalyptus trees are a_____to koalas.
25. Foreign_____in its environment are a great problem for koalas.
26. Hunting and forest fires kill off many koalas but now their number one threat is_____.

SECTION 3

You should spend about 20 minutes on Questions 27 — 40 which are based on Reading Passage 3 below:

Economizing of the Poor

A. Walking down the aisles of a supermarket, low-income shoppers must consider a number of factors including quantity, price, quality and nutritional differences when selecting food products. Food-purchase decisions by the poor often entail trade-offs among taste, preference and quality factors — either real or perceived — to meet spending constraints. Within broad product categories such as cereal, cheese, meat and poultry, and fruits and vegetables, shoppers can choose among many substitutable products. Low-income shoppers can stretch their food dollars in a number of ways. They may shop in discount food stores; they may purchase and consume less food than higher-income shoppers; they may purchase low-priced (and possibly lower quality) food products, or they may rely on some combination of all three. A better understanding of how the poor economize in food spending addresses important policy questions raised by researchers, nutrition educators, and food assistance program managers.

B. Whether the poor face significantly different food prices due to where they shop for food remains an unresolved empirical question. Extensive research over the years has tried to answer the question — Do the poor pay less for food? The Economic Research Service (ERS) in 1997 reviewed the results of studies comparing price differences in grocery stores across different income levels and combined these with current census data on the distribution of low-income households by urbanization type. The ERS study concluded that, in general, the poor face higher prices due to their greater representation in urban and rural areas (as opposed to suburban areas), where food prices tend to be higher.

C. Based on results from household surveys, ERS also found that despite facing higher prices, low-income shoppers spend less than higher-income shoppers for food

purchased in food stores. Due to their level of aggregation and lack of in-store sales and promotion information, such surveys shed little light on the economizing practices of households. To learn more about how low-income shoppers spend less on food despite facing higher prices, we obtained food-store purchase data that incorporate per-capita quantity and expenditure-measure equivalents (household measures adjusted for household size) across income levels.

D. The resulting comparisons describe how individuals with different levels of income vary in their food-spending patterns. By using actual transaction data, detailed information about the product purchased (for example, price, product description, package size, and brand name) as well as the condition of purchase (promotion, coupon, or sale item) was obtained. From there, the average unit cost (per ounce, per pound) for each item was calculated. Low-income shoppers may use four primary economizing practices to reduce their food spending. First, they may purchase a greater proportion of discounted products. Second, they may purchase more private-label products (generic or store brand) versus brand products than higher-income shoppers buy. Third, they may take advantage of volume discounts by purchasing larger package sizes. Fourth, they may purchase a less expensive food product within a product class. Although quality differences such as freshness, convenience and taste often contribute to prices differences; differences in nutritional quality also are evident.

E. The use of promotions is measured by comparing the percentage of expenditures and quantities of each product purchased on promotion (manufacturers' coupons, store coupons, store sales, and other promotions). For random-weight cheese, fruit, vegetables and meat in 1998, low-income households (less than \$25,000 per year) spent a greater share of expenditures for products on promotion than other households. (This also is true for quantities purchased on promotion.) For poultry, however, middle-income households spent about the same percentage on promotion as low-income households (36% versus 35%, respectively). For both groups, spending on promoting items was at least five percentage points more than spending by the high-income group.

F. Among fixed-weight products, promotion spending patterns differed. Low-income shoppers purchased the lowest share of total ready-to-eat (RTE) cereal on promotion. This result may be explained by other economizing practices in this product category — such as purchasing a larger percentage of private-label products, which are on promotion less often but have lower non-sale prices than the brand-name alternatives. Low-income households spent 11.5% of their RTE cereal expenditures on private-label cereals, while the higher-income households spent lower shares, with those shares decreasing with increasing income levels. A similar pattern is found for the quantities of private-label RTE cereal purchased.

G. Choice of package size also enables those in low-income households to economize by purchasing larger packages, which often have lower per-unit prices than smaller packages. However, data on expenditure shares for RTE cereal and packaged cheese show that low-income households' purchases of large packages of RTE cereal were less than such purchases by other households in 1998. In 1998, households earning \$50,000 or more spent 23.1% of cereal purchases on large packages, compared with 15.8% by the low-income group. A similar pattern was found for fixed-weight cheese products.

H. In fact, low-income households had the lowest proportion of large-package purchase of all income groups. This behaviour has three possible explanations: low-income shoppers do not have access to stores that sell large packages; they cannot afford to "stock up" on staple products, and they perceive that the cost of storing large packages is higher than the savings from the volume discount. A combination of these constraints likely accounts for much of the observed difference in package size quantities purchased and expenditures on those packages by the different income groups.

I. Low-income shoppers may also be economizing by purchasing a less costly combination of fruit and vegetable product types. On average, low-income households paid 11.5% less per pound for vegetables than high-income households, and 9.6% less per pound for fruit. This price measurement is a function of the quality and expenditures that each household type devotes to fruits and vegetables. Overall, low-income households purchased 3.3% less fruits and vegetables (by weight) per person than high-

income households, but they paid 13% less. This implies that these households are choosing less expensive fruits and vegetables.

Questions 27— 31

Choose the most suitable headings for paragraphs A— E from the list of headings below. Write appropriate numbers (i — x) in boxes 27 — 31 on your answer sheet. NB There are more headings than paragraphs, so you will not use them all.

List of Headings:

- i. Information asymmetry of low-income shoppers.
- ii. Promotion usage models.
- iii. More spending on promotional random weight items.
- iv. Various food-spending patterns.
- v. Higher prices but less spending.
- vi. Comprehending economizing of the poor.
- vii. An unresolved empirical question.
- viii. The correlation between the location and price.
- ix. The main economizing practices.
- x. Spending constraints the poor must consider.

27. Paragraph A
28. Paragraph B
29. Paragraph C
30. Paragraph D
31. Paragraph E

Questions 32 — 36

Do the following statements agree with the information given in Reading Passage 2? In boxes 32 — 36 on your answer sheet write

YES, if the statement agrees with the writer
NO, if the statement contradicts the writer
NOT GIVEN, if there is no information about this in the passage.

32. The surveys of ERS help low-income households develop economizing practices.
33. The nutritional quality of food product varies in accordance with price differences.
34. Promotions are usually used to attract low-income shoppers.
35. Brand-name products are promoted more frequently.
36. Middle-income households purchased less private-label RTE cereal than low-income households.

Questions 37 — 40

Choose your answers from the list below the summary. NB There are more words than spaces, so you will not use them all. Complete the summary below.

Large-package purchase can benefit low-income households in theory, but it seldom works in reality. There are three possible explanations for this discrepancy: ___37___, ___38___, and ___39___ constraints. Also, low-income shoppers may gain ___40___ on fruit and vegetable products.

List of Words:

measurement, budget, privilege, staple, volume, savings, quality, transportation, type, storage.

Reading Test 25

SECTION 1

You should spend about 20 minutes on Questions 1-13, which are based on Shading Passage 1 below.

Ants Could Teach Ants

A The ants are tiny and usually nest between rocks in the south coast of England. Transformed into research subjects at the University of Bristol, they raced along a tabletop foraging for food - and then, remarkably, returned to guide others. Time and again, followers trailed behind leaders, darting this way and that along the route, presumably to memorise landmarks. Once a follower got its bearings, it tapped the leader with its antennae, prompting the lesson to literally proceed to the next step. The ants were only looking for food, but the researchers said the careful way the leaders led followers, thereby turning them into leaders in their own right, marked the *Temnothorax albipennis* ant as the very first example of a non-human animal exhibiting teaching behaviour.

B "Tandem running is an example of teaching, to our knowledge the first in a non-human animal, that involves bidirectional feedback between teacher and pupil" remarks Nigel Franks, professor of animal behaviour and ecology, whose paper on the ant educators was published last week in the journal *Nature*.

C No sooner was the paper published, of course, than another educator questioned it. Marc Hauser, a psychologist and biologist and one of the scientists who came up with the definition of teaching, said it was unclear whether the ants had learned a new skill or merely acquired new information.

D Later, Franks took a further study and found that there were even races between leaders. With the guidance of leaders, ants could find food faster. But the help comes at

a cost for the leader, who normally would have reached the food about four times faster if not hampered by a follower. This means the hypothesis that the leaders deliberately slowed down in order to pass the skills on to the followers seems potentially valid. His ideas were advocated by the students who carried out the video project with him.

E Opposing views still arose, however. Hauser noted that mere communication of information is commonplace in the animal world. Consider a species, for example, that uses alarm calls to warn fellow members about the presence. Sounding the alarm can be costly, because the animal may draw the attention of the predator to itself. But it allows others flee to safety. “Would you call this teaching?” wrote Hauser. “The caller incurs a cost. The naive animals gain a benefit and new knowledge that better enables them to learn about the predator’s location than if the caller had not called. This happens throughout the animal kingdom, but we don’t call it teaching, even though it is clearly transfer of information.”

F Tim Caro, a zoologist, presented two cases of animal communication. He found that cheetah mothers that take their cubs along on hunts gradually allow their cubs to do more of the hunting —going, for example, from killing a gazelle and allowing young cubs to eat merely tripping the gazelle and letting the cubs finish it off. At one level, such behaviour might be called teaching — except the mother was not really teaching the cubs to hunt but merely facilitating various stages of learning. In another instance, birds watching other birds using a stick to locate food such as insects and so on, are observed to do the same thing themselves while finding food later.

G Psychologists study animal behaviour in part to understand the evolutionary roots of human behaviour, Hauser said. The challenge in understanding whether other animals truly teach one another, he added, is that human teaching involves a “theory of mind” teachers are aware that students don’t know something. He questioned whether Franks’ leader ants really knew that the follower ants were ignorant. Could they simply have been following an instinctive rule to proceed when the followers tapped them on the legs or abdomen? And did leaders that led the way to food — only to find that it had been removed by the experimenter - incur the wrath of followers? That,

Hauser said, would suggest that the follower ant actually knew the leader was more knowledgeable and not merely following an instinctive routine itself.

H The controversy went on, and for a good reason. The occurrence of teaching in ants, if proven to be true, indicates that teaching can evolve in animals with tiny brains. It is probably the value of information in social animals that determines when teaching will evolve, rather than the constraints of brain size.

I Bennett Galef Jr., a psychologist who studies animal behaviour and social learning at McMaster University in Canada, maintained that ants were unlikely to have a "theory of mind" — meaning that leaders and followers may well have been following instinctive routines that were not based on an understanding of what was happening in another ant's brain. He warned that scientists may be barking up the wrong tree when they look not only for examples of humanlike behaviour among other animals but humanlike thinking that underlies such behaviour. Animals may behave in ways similar to humans without a similar cognitive system, he said, so the behaviour is not necessarily a good guide into how humans came to think the way they do.

Questions 1-5

Look at the following statements (Questions 1-5) and the list of people in the box below. Match each statement with the correct person, A, B C or D.

Write the correct letter, A, B, C or D, in boxes 1-5 on your answer sheet NB You may use any letter more than once.

1. Animals could use objects to locate food.
2. Ants show two-way, interactive teaching behaviours.
3. It is risky to say ants can teach other ants like human beings do,
4. Ant leadership makes finding food faster.

5. Communication between ants is not entirely teaching.

List of people

A Nigel Granks

B Marc Hauser

C Tim Caro

D Bennet Galef Jr

Questions 6-9

Choose FOUR letters, A-H.

Write your answers in boxes 6-9 on your answer sheet.

Which FOUR of the following behaviours of animals are mentioned in the passage?

- A. touch each other with antenna
- B. alert others when there is danger
- C. escape from predators
- D. protect the young
- E. hunt food for the young
- F. fight with each other
- G. use tools like twigs
- H. feed on a variety of foods

Questions 10-13

Do the following statements agree with the claims of the writer in Reading Passage 1?

In boxes 10-13 on your answer sheet, write

TRUE	if the statement is true
FALSE	if the statement is false
NOT GIVEN	if the information is not given in the passage

10. Ants, 'tandem running' involves only one-way communication.

11. Franks's theory got many supporters immediately after publicity.
12. Ants' teaching behaviour is the same as that of human.
13. Cheetah share hunting gains to younger ones

SECTION 2

Wealth in a cold climate

A Dr William Masters was reading a book about mosquitoes when inspiration struck. "There was this anecdote about the great yellow fever epidemic that hit Philadelphia in 1793," Masters recalls. "This epidemic decimated the city until the first frost came." The inclement weather froze out the insects, allowing Philadelphia to recover

B If weather could be the key to a city's fortunes, Masters thought, then why not to the historical fortunes of nations? And could frost lie at the heart of one of the most enduring economic mysteries of all — why are almost all the wealthy, industrialised nations to be found at latitudes above 40 degrees? After two years of research, he thinks that he has found a piece of the puzzle. Masters, an agricultural economist from Purdue University in Indiana, and Margaret McMillan at Tufts University, Boston, show that annual frosts are among the factors that distinguish rich nations from poor ones. Their study is published this month in the *Journal of Economic Growth*. The pair speculates that cold snaps have two main benefits — they freeze pests that would otherwise destroy crops, and also freeze organisms, such as mosquitoes, that carry disease. The result is agricultural abundance a big workforce

C The academics took two sets of information. The first was average income for countries, the second climate data from the University of East Anglia. They found a curious tally between the sets. Countries having five or more frosty days a month are uniformly rich; those with fewer than five are impoverished. The authors speculate that the five-day figure is important; it could be the minimum time needed to kill pests in the soil. Masters says: "For example, Finland is a small country that is growing quickly, but Bolivia is a small country that isn't growing at all. Perhaps climate has something to do with that." In fact, limited frosts bring huge benefits to farmers. The chills kill insects or render them inactive; cold weather slows the break-up of plant and animal material in the soil, allowing it to become richer; and frosts ensure a build-up of moisture in the ground for spring, reducing dependence on seasonal rains. There are exceptions to the

"cold equals rich" argument. There are well-heeled tropical countries such as Hong Kong and Singapore (both city-states, Masters notes), a result of their superior trading positions. Likewise, not all European countries are moneyed — in the former communist colonies, economic potential was crushed by politics.

D Masters stresses that climate will never be the overriding factor —the wealth of nations is too complicated to be attributable to just one factor. Climate, he feels, somehow combines with other factors — such as the presence of institutions, including governments, and access to trading routes — to determine whether a country will do well. Traditionally, Masters says, economists thought that institutions had the biggest effect on the economy, because they brought order to a country in the form of, for example, laws and property rights. With order, so the thinking went, came affluence. "But there are some problems that even countries with institutions have not been able to get around," he says. "My feeling is that, as countries get richer, they get better institutions. And the accumulation of wealth and improvement in governing institutions are both helped by a favourable environment, including climate.

E This does not mean, he insists, that tropical countries are beyond economic help and destined to remain penniless. Instead, richer countries should change the way in which foreign aid is given. Instead of aid being geared towards improving governance, it should be spent on technology to improve agriculture and to combat disease. Masters cites one example: "There are regions in India that have been provided with irrigation — agricultural productivity has gone up and there has been an improvement in health." Supplying vaccines against tropical diseases and developing crop varieties that can grow in the tropics would break the poverty cycle.

F Other minds have applied themselves to the split between poor and rich nations, citing anthropological, climatic and zoological reasons for why temperate nations are the most affluent. In 350BC, Aristotle observed that "those who live in a cold climate . . . are full of spirit". Jared Diamond, from the University of California at Los Angeles, pointed out in his book *Guns, Germs and Steel* that Eurasia is broadly aligned east-west, while Africa and the Americas are aligned north-south. So, in Europe, crops can spread quickly across latitudes because climates are similar. One of the first

domesticated crops, einkorn wheat, spread quickly from the Middle East into Europe; it took twice as long for corn to spread from Mexico to what is now the eastern United States. This easy movement along similar latitudes in Eurasia would also have meant a faster dissemination of other technologies such as the wheel and writing, Diamond speculates. The region also boasted domesticated livestock, which could provide meat, wool and motive power in the fields. Blessed with such natural advantages, Eurasia was bound to take off economically.

G John Gallup and Jeffrey Sachs, two US economists, have also pointed out striking correlations between the geographical location of countries and their wealth. They note that tropical countries between 23.45 degrees north and south of the equator are nearly all poor. In an article for the Harvard International Review, they concluded that "development surely seems to favour the temperate-zone economies, especially those in the northern hemisphere, and those that have managed to avoid both socialism and the ravages of war". But Masters cautions against geographical determinism, the idea that tropical countries are beyond hope: "Human health and agriculture can be made better through scientific and technological research," he says, "so we shouldn't be writing off these countries. Take Singapore: without air conditioning, it wouldn't be rich."

Questions 14-20

The reading passage has seven paragraphs, A-G
Choose the correct heading for paragraphs A-G from the list below.
Write the correct number, i-x, in boxes 14-20 on your answer sheet.

List of Headings

- i. The positive correlation between climate and wealth
- ii. Other factors besides climate that influence wealth
- iii. Inspiration from reading a book
- iv. Other researchers' results do not rule out exceptional cases
- v. different attributes between Eurasia and Africa
- vi. Low temperature benefits people and crops
- vii. The importance of institution in traditional views.

- viii. The spread of crops in Europe, Asia and other places
- ix. The best way to use aid
- x. Confusions and exceptional

- 14. Paragraph A
- 15. Paragraph B
- 16. Paragraph C
- 17. Paragraph D
- 18. Paragraph E
- 19. Paragraph F
- 20. Paragraph G

Questions 21-26

Complete the following summary of the paragraphs of Reading Passage, using no more than two words from the Reading Passage for each answer. Write your answers in boxes 21-26 on your answer sheet.

Dr William Master read a book saying that a(an) 21 which struck an American city of years ago was terminated by a cold frost. And academics found that there is a connection between climate and country's weathy as in the rich but small country of 22..... ; Yet besides excellent surroundings and climate, one country still need to improve both their 23..... to achieve long prosperity,

Thanks to resembling weather condition across latitude in the continent of 24..... 'crops such as 25is bound to spread faster than from South America to the North. Other researchers also noted that even though geographical factors are important, tropical country such as 26 still became rich due to scientific advancement.

SECTION 3

You should spend about 20 minutes on Questions 1-14 which are based on Reading Passage below.

Compliance or Noncompliance for children

A Many Scientists believe that socialization takes a long process, while compliance is the outset of it. Accordingly, compliance for education of children is the priority. Motivationally distinct forms of child compliance, mutually positive affect, and maternal control, observed in 3 control contexts in 103 dyads of mothers and their 26-41-month-old children, were examined as correlates of internalization, assessed using observations of children while alone with prohibited temptations and maternal ratings. One form of compliance (committed compliance), when the child appeared committed wholeheartedly to the maternal agenda and eager to endorse and accept it, was emphasized. Mother-child mutually positive affect was both a predictor and a concomitant of committed compliance. Children who shared positive affect with their mothers showed a high level of committed compliance and were also more internalized. Differences and similarities between children's compliance to requests and prohibitions ("Do " vs. "Don't" demand contexts) were also explored. Maternal "Dos" appeared more challenging to toddlers than the "Don'ts." Some individual coherence of behavior was also found across both demand contexts. The implications of committed compliance for emerging internalized regulators of conduct are discussed.

B A number of parents were not easy to be aware of the compliance, some even overlooked their children's noncompliance. Despite good education, these children did not follow the words from their parents on several occasion 'especially boys in certain ages. Fortunately, this rate was acceptable; some parents could be patient with the noncompliance. .Someone held that noncompliance is probably not a wrong thing. In order to determine the effects of different parental disciplinary techniques on young children's compliance and noncompliance, mothers were trained to observe emotional

incidents involving their own toddler-aged children. Reports of disciplinary encounters were analyzed in terms of the types of discipline used (reasoning, verbal prohibition, physical coercion, love withdrawal, and combinations thereof) and children's responses to that discipline (compliance/ noncompliance and avoidance). The relation between compliance/ noncompliance and type of misdeed (harm to persons, harm to property, and lapses of self-control) was also analyzed. Results indicated that love withdrawal combined with other techniques was most effective in securing children's compliance and that its effectiveness was not a function of the type of technique with which it was combined. Avoidant responses and affective reunification with the parent were more likely to follow love withdrawal than any other technique. Physical coercion was somewhat less effective than love withdrawal, while reasoning and verbal prohibition were not at all effective except when both were combined with physical coercion.

C Noncompliant Children sometimes prefer to say no directly as they were younger, they are easy to deal with the relationship with contemporaries. when they are growing up. During the period that children is getting elder, who may learn to use more advanced approaches for their noncompliance. They are more skillful to negotiate or give reasons for refusal rather than show their opposite idea to parents directly/' Said Henry Porter, scholar working in Psychology Institute of UK. He indicated that noncompliance means growth in some way, may have benefit for children. Many Experts held different viewpoints in recent years, they tried drilling compliance into children. His collaborator Wallace Freisen believed that Organizing child's daily activities so that they occur in the same order each day as much as possible. This first strategy for defiant children is ultimately the most important. Developing a routine helps a child to know what to expect and increases the chances that he or she will comply with things such as chores, homework, and hygiene requests. When undesirable activities occur in the same order at optimal times during the day, they become habits that are not questioned, but done without thought.

Chances are that you have developed some type of routine for yourself in terms of showering, cleaning your house, or doing other types of work. You have an idea in your mind when you will do these things on a regular basis and this helps you to know what

to expect. In fact, you have probably already been using most of these compliance strategies for yourself without realizing it. For children, without setting these expectations on a daily basis by making them part of a regular routine, they can become very upset. Just like adults, children think about what they plan to do that day and expect to be able to do what they want. So, when you come along and ask them to do something they weren't already planning to do that day, this can result in automatic refusals and other undesirable defiant behavior. However, by using this compliance strategy with defiant children, these activities are done almost every day in the same general order and the child expects to already do them.

D Doctor Steven Walson addressed that organizing fun activities to occur after frequently refused activities. This strategy also works as a positive reinforcer when the child complies with your requests. By arranging your day so that things often refused occur right before highly preferred activities, you are able to eliminate defiant behavior and motivate your child's behavior of doing the undesirable activity. This is not to be presented in a way that the preferred activity is only allowed if a defiant child does the non-preferred activity. However, you can word your request in a way so that your child assumes that you have to do the non-preferred activity before moving on to the next preferred activity. For example, you do not want to say something such as, "If you clean your room we can play a game." Instead word your request like this, "As soon as you are done cleaning your room we will be able to play that really fun game you wanted to play."

E Psychologist Paul Edith insisted praise is the best way to make children to comply with. This is probably a common term you are used to hearing by now. If you praise your child's behavior, he or she will be more likely to do that behavior. So, it is essential to use praise when working with defiant children. It also provides your child with positive attention. However, it is important to know how to praise children in a way that encourages future automatic reinforcement for your child when doing a similar behavior.

Questions 27-31

Choose the correct letter, A, B, C or D.

Write the correct letter in boxes 27-31 on your answer sheet,

27. The children, especially boys received good education may

- A. always comply with their parents, words
- B. be good at math
- C. have a high score at school
- D. disobey their parents' order sometimes

28. to their children's compliance and noncompliance, parents

- A. must be aware of the compliance
- B. ask for help from their teachers
- C. some of them may ignore their noncompliance
- D. pretend not to see

29. According to Henry Porter noncompliance for children

- A. are entirely harmful
- B. may have positive effects
- C. needs medicine assistance
- D. should be treated by expert doctor

30. When children are growing up, they

- A. always try to directly say no
- B. are more skillful to negotiate
- C. learn to cheat instead of noncompliance
- D. tend to keep silent

31. Which is the possible reaction the passage mentioned for elder children and younger ones if they don't want to comply with the order

- A. elder children prefer to refuse directly
- B. elder ones refuse to answer
- C. younger children may reject directly
- D. younger ones may save any words

Questions 32-35

Look at the following people and list of statements below. Match each person with the correct statement.

Write the correct letter A-G in boxes 32-35 on your answer sheet.

- 32. Henry Porter
- 33. Wallace Freisen
- 34. Steven Walson
- 35. Paul Edith

List of statements
A children of all ages will indirectly show noncompliance
B elder children tend to negotiate rather than show noncompliance C converse behavior means noncompliance
D organizing fun activities to occur after frequently refused activities
E organizing child's daily activities in the same order as much as possible.

F use praise in order to make children compliant

G take the children to school at a early age

Questions 36-40

Do the following statements agree with the claims of the writer in Reading Passage? In boxes 36-40 on your answer sheet, write

TRUE	if the statement is true
FALSE	if the statement is false
NOT GIVEN	if the information is not given in the passage

36. Socialization takes a long process, while compliance is the beginning of it.
37. Many parents were difficult to be aware of the compliance or noncompliance.
38. Noncompliant Children are simple to deal with the relationship with the people in the same age when they are growing up.
39. Experts never tried drilling compliance into children.
40. Psychologist Paul Edith negated the importance that knowing how to praise children in an encouraged way.

Reading Test 26

SECTION 1

Plant Scents

A Everyone is familiar with scented flowers, and many people have heard that floral odors help the plant attract pollinators. This common notion is mostly correct, but it is surprising how little scientific proof of it exists. Of course, not all flowers are pollinated by biological agents—for example, many grasses are wind-pollinated—but the flowers of the grasses may still emit volatiles. In fact, plants emit organic molecules all the time, although they may not be obvious to the human nose. As for flower scents that we can detect with our noses, bouquets that attract moths and butterflies generally smell “sweet,” and those that attract certain flies seem “rotten” to us.

B The release of volatiles from vegetative parts of the plant is familiar, although until recently the physiological functions of these chemicals were less clear and had received much less attention from scientists. When the trunk of a pine tree is injured—for example, when a beetle tries to burrow into it—it exudes a very smelly resin. This resin consists mostly of terpenes—hydrocarbons with a backbone of 10, 15 or 20 carbons that may also contain atoms of oxygen. The heavier C₂₀ terpenes, called diterpenes, are glue-like and can cover and immobilize insects as they plug the hole. This defense mechanism is as ancient as it is effective: Many samples of fossilized resin, or amber, contain the remains of insects trapped inside. Many other plants emit volatiles when injured, and in some cases the emitted signal helps defend the plant. For example, (Z)-3-hexenyl acetate, which is known as a “green leaf volatile” because it is emitted by many plants upon injury, deters females of the moth *Heliothis virescens* from laying eggs on injured tobacco plants. Interestingly, the profile of emitted tobacco volatiles is different at night than during the day, and it is the nocturnal blend, rich in several (Z)-3-hexenyl-olesters, that is most effective in repelling the night-active *H. virescens* moths.

C Herbivore induced volatiles often serve as indirect defenses. These bulwarks exist in

a variety of plant species, including corn, beans, and the model plant species *Arabidopsis thaliana*. Plants not only emit volatiles acutely, at the site where caterpillars, mites, aphids or similar insects are eating them, but also generally from non-damaged parts of the plant. These signals attract a variety of predatory insects that prey on the plant-eaters. For example, some parasitic wasps can detect the volatile signature of a damaged plant and will lay their eggs inside the offending caterpillar; eventually the wasp eggs hatch, and the emerging larvae feed on the caterpillar from the inside out. The growth of infected caterpillars is retarded considerably, to the benefit of the plant. Similarly, volatiles released by plants in response to herbivore egg laying can attract parasites of the eggs, thereby preventing them from hatching and avoiding the onslaught of hungry herbivores that would have emerged. Plant volatiles can also be used as a kind of currency in some very indirect defensive schemes. In the rainforest understory tree *Leonardoxa africana*, ants of the species *Petalomyrmex phylax* patrol young leaves and attack any herbivorous insects that they encounter. The young leaves emit high levels of the volatile compound methyl salicylate, a compound that the ants use either as a pheromone or as an antiseptic in their nests. It appears that methyl salicylate is both an attractant and a reward offered by the tree to get the ants to perform this valuable deterrent role.

D Floral scent has a strong impact on the economic success of many agricultural crops that rely on insect pollinators, including fruit trees such as the bee-pollinated cherry, apple, apricot and peach, as well as vegetables and tropical plants such as papaya. Pollination not only affects crop yield, but also the quality and efficiency of crop production. Many crops require most, if not all, ovules to be fertilized for optimum fruit size and shape. A decrease in fragrance emission reduces the ability of flowers to attract pollinators and results in considerable losses for growers, particularly for introduced species that had a specialized pollinator in their place of origin. This problem has been exacerbated by recent disease epidemics that have killed many honeybees, the major insect pollinators in the United States.

E One means by which plant breeders circumvent the pollination problem is by breeding self-compatible, or apomictic, varieties that do not require fertilization. Although this

solution is adequate, its drawbacks include near genetic uniformity and consequent susceptibility to pathogens. Some growers have attempted to enhance honeybee foraging by spraying scent compounds on orchard trees, but this approach was costly, had to be repeated, had potentially toxic effects on the soil or local biota, and, in the end, proved to be inefficient. The poor effectiveness of this strategy probably reflects inherent limitations of the artificial, topically applied compounds, which clearly fail to convey the appropriate message to the bees. For example, general spraying of the volatile mixture cannot tell the insects where exactly the blossoms are. Clearly, a more refined strategy is needed. The ability to enhance existing floral scent, create scent de novo or change the characteristics of the scent, which could all be accomplished by genetic engineering, would allow us to manipulate the types of insect pollinators and the frequency of their visits. Moreover, the metabolic engineering of fragrance could increase crop protection against pathogens and pests.

F Genetic manipulation of scent will also benefit the floriculture industry. Ornamentals, including cut flowers, foliage and potted plants, play an important aesthetic role in human life. Unfortunately, traditional breeding has often produced cultivars with improved vase life, shipping characteristics, color and shape while sacrificing desirable perfumes. The loss of scent among ornamentals, which have a worldwide value of more than \$30 billion, makes them important targets for the genetic manipulation of flower fragrance. Some work has already begun in this area, as several groups have created petunia and carnation plants that express the linalool synthase gene from *C. Breweri*. These experiments are still preliminary: For technical reasons, the gene was expressed everywhere in the plant, and although the transgenic plants did create small amounts of linalool, the level was below the threshold of detection for the human nose. Similar experiments in tobacco used genes for other monoterpene synthases, such as the one that produces limonene, but gave similar results.

G The next generation of experiments, already in progress, includes sophisticated schemes that target the expression of scent genes specifically to flowers or other organs—such as special glands that can store antimicrobial or herbivore-repellent compounds.

Questions 1-4

The reading Passage has seven paragraphs A-G. Which paragraph contains the following information?

Write the correct letter A-G, in boxes 1-4 on your answer sheet.

1. Substance released to help plants themselves.
2. Scent helps plant's pollination.
3. Practice on genetic experiment of fragrance.
4. Plant's scent attracts herbivore's enemy for protection.

Questions 5-8

Do the following statements agree with the information given in Reading Passage 1?

In boxes 5-8 on your answer sheet, write

TRUE	if the statement is true
FALSE	if the statement is false
NOT GIVEN	if the information is not given in the passage

5. We have few evidence to support the idea that scent attracts pollinators.
6. *Heliothis virescens* won't eat those tobacco leaves on which they laid eggs.
7. Certain ants are attracted by volatiles to guard plants in rainforest.
8. Pollination only affects fruit trees' production rather than other crop trees.

Questions 9-13

Choose the correct letter, A, B, C or D.

Write your answers in boxes 9-13 on your answer sheet.

9. How do wasps protect plants when they are attracted by scents according to the passage?

- A. plants induce wasps to prey herbivore.
- B. wasps lay eggs into caterpillars.
- C. wasps laid eggs on plants to expel herbivore.
- D. offending caterpillars and wasp eggs coexist well.

10. What reason caused number of honeybees decline in the United States.

- A. pollination process
- B. spread illness
- C. crop trees are poisonous
- D. grower's overlook

11. Which of the following drawbacks about artificial fragrance is NOT mentioned in the passage?

- A. it's very expensive
- B. it can't tell correct information to pollinators.
- C. it needs massive manual labour
- D. it poisons local environment

12. The number of \$30 billion quoted in the passage is to illustrate the fact that:

- A favorable perfumes are made from ornamental flowers
- B traditional floriculture industry needs reform.
- C genetic operation on scent can make vast profit.
- D Scent plays a significant role in Ornamental industry.

13. What is weakness of genetic experiments on fragrance?

- A. Linalool level is too low to be smelt by nose
- B. no progress made in linalool emission
- C. experiment on tobacco has a better result
- D. transgenic plants produce intense scent

SECTION 2

You should spend about 20 minutes on Questions 14-26, which are based on Reading Passage 2 below.

The Development of Plastics

A When rubber was first commercially produced in Europe during the nineteenth century, it rapidly became a very important commodity, particularly in the fields of transportation and electricity. However, during the twentieth century a number of new synthetic materials, called plastics, superseded natural rubber in all but a few applications.

B Rubber is a polymer — a compound containing large molecules that are formed by the bonding of many smaller, simpler units, repeated over and over again. The same bonding principle — polymerisation — underlies the creation of a huge range of plastics by the chemical industry.

C The first plastic was developed as a result of a competition in the USA. In the 1860s, \$10,000 was offered to anybody who could replace ivory — supplies of which were declining — with something equally good as a material for making billiard balls. The prize was won by John Wesley Hyatt with a material called celluloid. Celluloid was made by dissolving cellulose, a carbohydrate derived from plants, in a solution of camphor dissolved in ethanol. This new material rapidly found uses in the manufacture of products such as knife handles, detachable collars and cuffs, spectacle frames and photographic film. Without celluloid, the film industry could never have got off the ground at the end of the 19th century.

D Celluloid can be repeatedly softened and reshaped by heat, and is known as a thermoplastic. In 1907 Leo Baekeland, a Belgian chemist working in the USA, invented a different kind of plastic by causing phenol and formaldehyde to react together. Baekeland called the material Bakelite, and it was the first of the thermosets'

plastics that can be cast and moulded while hot, but cannot be softened by heat and reshaped once they have set. Bakelite was a good insulator, and was resistant to water, acids and moderate heat. With these properties it was soon being used in the manufacture of switches, household items, such as knife handles, and electrical components for cars.

E Soon chemists began looking for other small molecules that could be strung together to make polymers. In the 1930s, British chemists discovered that the gas ethylene would polymerise under heat and pressure to form a thermoplastic they called polythene. Polypropylene followed in the 1950s. Both were used to make bottles, pipes and plastic bags. A small change in the starting material — replacing a hydrogen atom in ethylene with a chlorine atom — produced PVC (polyvinyl chloride) , a hard, fireproof plastic suitable for drains and gutters. And by adding certain chemicals, a soft form of PVC could be produced, suitable as a substitute for rubber in items such as waterproof clothing. A closely related plastic was Teflon, or PTFE (polytetrafluoroethylene). This had a very low coefficient of friction, making it ideal for bearings, rollers, and non-stick frying pans. Polystyrene, developed during the 1930s in Germany, was a clear, glass-like material, used in food containers, domestic appliances and toys. Expanded polystyrene — a white, rigid foam — was widely used in packaging and insulation. Polyurethanes, also developed in Germany, found uses as adhesives, coatings, and — in the form of rigid foams — as insulation materials. They are all produced from chemicals derived from crude oil, which contains exactly the same elements —carbon and hydrogen —as many plastics.

F The first of the man-made fibres, nylon, was also created in the 1930s. Its inventor was a chemist called Wallace Carothers, who worked for the Du Pont Company in the USA. He found that under the right conditions, two chemicals — hexamethylenediamine and adipic acid would form a polymer that could be pumped out through holes and then stretched to form long glossy threads that could be woven like silk. Its first use was to make parachutes for the US armed forces in World War II. In the post-war years nylon completely replaced silk in the manufacture of stockings. Subsequently many other synthetic fibres joined nylon, including Orion, Acrilan and Terylene. Today most

garments are made of a blend of natural fibres, such as cotton and wool, and man-made fibres that make fabrics easier to look after.

G The great strength of plastic is its indestructibility. However, this quality is also something of a drawback: beaches all over the world, even on the remotest islands, are littered with plastic bottles that nothing can destroy. Nor is it very easy to recycle plastics , as different types of plastic are often used in the same items and call for different treatments. Plastics can be made biodegradable by incorporating into their structure a material such as starch, which is attacked by bacteria and causes the plastic to fall apart. Other materials can be incorporated that gradually decay in sunlight — although bottles made of such materials have to be stored in the dark, to ensure that they do not disintegrate before they have been used.

Questions 14-20

Complete the table below.

Choose NO MORE THAN THREE WORDS from the passage for each answer. Write your answers in boxes 14-20 on your answer sheet.

Name of plastic	Date of invention	Original region	Property	Common use
Celluloid	1860s	US		Clothing and 14 _____
15 _____	1907	US	can be cast and moulded but cannot be softened by heat	16 _____ 'household items and car parts
Polythene	1930s	17 _____		bottles
Rigid PVC			18 _____	drains and gutters
Polystyrene	1930s	Germany	transparent and resembled to 19 _____	Food containers domestic
Polyurethanes		Germany	formation like 20 _____	adhesives, coatings and insulation

Questions 21-26

Do the following statements agree with the information given in Reading Passage 2? In boxes 21-26 on your answer sheet, write

TRUE	if the statement is true
FALSE	if the statement is false
NOT GIVEN	if the information is not given in the passage

21. The chemical structure of plastic is very different from that of rubber.
22. John Wesley was a famous chemist.
23. Celluloid and Bakelite react to heat in the same way.
24. The mix of different varieties of plastic can make them less recyclable.
25. Adding starch into plastic does not necessarily make plastic more durable.
26. Some plastic containers have to be preserved in special conditions.

SECTION 3

You should spend about 20 minutes on Questions 27-40, which are based on Reading Passage 3 below.

Global Warming in New Zealand

A For many environmentalists, the world seems to be getting warmer. As the nearest country of South Polar Region, New Zealand has maintained an upward trend in its average temperature in the past few years. However, the temperature in New Zealand will go up 4°C in the next century while the polar region will go up more than 6°C. The different pictures of temperature stem from its surrounding ocean which acts like the air conditioner. Thus New Zealand is comparatively fortunate.

B Scientifically speaking, this temperature phenomenon in New Zealand originated from what researchers call "SAM (Southern Annular Mode), which refers to the wind belt that circles the Southern Oceans including New Zealand and Antarctica. Yet recent work has revealed that changes in SAM in New Zealand have resulted in a weakening of moisture during the summer, and more rainfall in other seasons. A bigger problem may turn out to be heavier droughts for agricultural activities because of more water loss from soil, resulting in poorer harvest before winter when the rainfall arrive too late to rescue.

C Among all the calamities posed by drought, moisture deficit ranks the first. Moisture deficit is the gap between the water plants need during the growing season and the water the earth can offer. Measures of moisture deficit were at their highest since the 1970s in New Zealand. Meanwhile, ecological analyses clearly show moisture deficit is imposed at different growth stage of crops. If moisture deficit occurs around a crucial growth stage, it will cause about 22% reduction in grain yield as opposed to moisture deficit at vegetative phase.

D Global warming is not only affecting agriculture production. When scientists say the country's snow pack and glaciers are melting at an alarming rate due to global warming,

the climate is putting another strain on the local places. For example, when the development of global warming is accompanied by the falling snow line, the local skiing industry comes into a crisis. The snow line may move up as the temperature goes up, and then the snow at the bottom will melt earlier. Fortunately, it is going to be favourable for the local skiing industry to tide over tough periods since the quantities of snowfall in some areas are more likely to increase.

E What is the reaction of glacier region? The climate change can be reflected in the glacier region in southern New Zealand or land covered by ice and snow. The reaction of a glacier to a climatic change involves a complex chain of processes, Over time periods of years to several decades, cumulative changes in mass balance cause volume and thickness changes, which will affect the flow of ice via altered internal deformation and basal sliding. This dynamic reaction finally leads to glacier length changes, the advance or retreat of glacier tongues. Undoubtedly, glacier mass balance is a more direct signal of annual atmospheric conditions.

F The latest research result of National Institute of Water and Atmospheric (NIWA) Research shows that glaciers line keeps moving up because of the impacts of global warning. Further losses of ice can be reflected in Mt. Cook Region. By 1996, a 14 km long sector of the glacier had melted down forming a melt lake (Hooker Lake) with a volume. Melting of the glacier front at a rate of 40 m/yr will cause the glacier to retreat at a rather uniform rate. Therefore, the lake will continue to grow until it reaches the glacier bed.

G A direct result of the melting glaciers is the change of high tides that serves the main factor for sea level rise. The trend of sea level rise will bring a threat to the groundwater system for its hyper-saline groundwater and then pose a possibility to decrease the agricultural production. Many experts believe that the best way to counter this trend is to give a longer-term view of sea level change in New Zealand. Indeed, the coastal boundaries need to be upgraded and redefined.

H There is no doubt that global warming has affected New Zealand in many aspects. The emphasis on the global warming should be based on the joints efforts of local

people and experts who conquer the tough period. For instance, farmers are taking a long term, multi- generational approach to adjust the breeds and species according to the temperature. Agriculturists also find ways to tackle the problems that may bring to the soil. In broad terms, going forward, the systemic resilience that's been going on a long time in the ecosystem will continue.

I How about animals' reaction? Experts have surprisingly realised that animals have unconventional adaptation to global warming. A study has looked at sea turtles on a few northern beaches in New Zealand and it is very interesting to find that sea turtles can become male or female according to the temperature. Further researches will try to find out how rising temperatures would affect the ratio of sex reversal in their growth. Clearly, the temperature of the nest plays a vital role in the sexes of the baby turtles.

J Tackling the problems of global warming is never easy in New Zealand, because records show the slow process of global warming may have a different impact on various regions. For New Zealand, the emission of carbon dioxide only accounts for 0.5% of the world's total, which has met the governmental standard. However, New Zealand's effort counts only a tip of the iceberg. So far, global warming has been a world issue that still hangs in an ambiguous future.

Questions 27-32

Choose the correct letter, A, B, C or D.

Write the correct letter in boxes 27-32 on your answer sheet.

27. What is the main idea of the first paragraph?

- A. The temperature in the polar region will increase less than that in New Zealand in the next century.
- B. The weather and climate of New Zealand is very important to its people because of its close location to the polar region.
- C. The air condition in New Zealand will maintain a high quality because of the ocean.
- D. The temperature of New Zealand will increase less than that of other regions in the next 100 years because it is surrounded by sea.

28. What is one effect of the wind belt that circles the Southern Oceans?

- A. New Zealand will have more moisture in winds in summer.
- B. New Zealand needs to face droughts more often in hotter months in a year.
- C. Soil water will increase as a result of weakening moisture in the winds.
- D. Agricultural production will be reduced as a result of more rainfall in other seasons.

29. What does “moisture deficit” mean to the grain and crops?

- A. The growing condition will be very tough for crops.
- B. The growing season of some plants can hardly be determined.
- C. There will be a huge gap between the water plants needed and the water the earth can offer.
- D. The soil of grain and crops in New Zealand reached its lowest production since 1970s.

30. What changes will happen to skiing industry due to the global warming phenomenon?

- A. The skiing station may lower the altitude of skiing.
- B. Part of the skiing station needs to move to the north.
- C. The snowfall may increase in part of the skiing station.
- D. The local skiing station may likely to make a profit because of the snowfall increase.

31. Cumulative changes over a long period of time in mass balance will lead to

- A. alterations in the volume and thickness of glaciers.
- B. faster changes in internal deformation and basal sliding.
- C. bigger length of glaciers.
- D. retreat of glacier tongues as a result of change in annual atmospheric conditions.

32. Why does the writer mention NIWA in the sixth paragraph?

- A. To use a particular example to explain the effects brought by glacier melting.
- B. To emphasize the severance of the further loss of ice in Mt. Cook Region.
- C. To alarm the reader of melting speed of glaciers at a uniform rate.
- D. To note the lake in the region will disappear when it reach the glacier bed.

Questions 33-35

Complete the summary below.

Choose **NO MORE THAN TWO WORDS** from the passage for each answer. Write your answers in boxes 33-35 on your answer sheet

Research data shows that sea level has a closely relation with the change of climate. The major reason for the increase in sea level is connected with 33_____, The increase in sea level is also said to have a threat to the underground water system, the destruction of which caused by rise of sea level will lead to a high probability of reduction in 34_____. In the long run, New Zealanders may have to improve the 35_____if they want to diminish the effect change in sea levels.

Questions 36-40

Do the following statements agree with the claims of the writer in Reading Passage 3?

In boxes 36-40 on your answer sheet, write

YES	if the statement agrees with the claims of the writer.
NO	if the statement contradicts the claims of the writer
NOT GIVEN	if it is impossible to say what the writer thinks about this

- 36. Farmers are less responsive to climate change than agriculturists.
- 37. Agricultural sector is too conservative and deal with climate change.
- 38. Turtle is vulnerable to climate change.
- 39. The global warming is going slowly, and it may have different effects on different areas in New Zealand
- 40. New Zealand must cut carbon dioxide emission if they want to solve the problem of global warming.

Reading Test 27

SECTION 1

Grey Workers

A Given the speed at which their workers are growing greyer, employers know surprisingly little about how productive they are. The general assumption is that the old are paid more in spite of, rather than because of, their extra productivity. That might partly explain why, when employers are under pressure to cut costs, they persuade the 55-year-olds to take early retirement. Earlier this year, Sun Life of Canada, an insurance company, announced that it was offering redundancy to all its British employees aged 50 or over “to bring in new blood”.

B In Japan, says Mariko Fujiwara, an industrial anthropologist who runs a think-tank for Hakuhodo, Japan’s second-largest advertising agency, most companies are bringing down the retirement age from the traditional 57 to 50 or thereabouts - and in some cases, such as Nissan, to 45. More than perhaps anywhere else, pay in Japan is linked to seniority. Given that the percentage of workers who have spent more than 32 years with the same employer rose from 11% in 1980 to 42% by 1994, it is hardly surprising that seniority-based wage costs have become the most intractable item on corporate profit- and-loss accounts.

C In Germany, Patrick Pohl, spokesman for Hoechst, expresses a widely held view: “The company is trying to lower the average age of the workforce. Perhaps the main reason for replacing older workers is that it makes it easier to ‘defrost’ the corporate culture. Older workers are less willing to try a new way of thinking. Younger workers are cheaper and more flexible.” Some German firms are hampered from getting rid of older workers as quickly as they would like. At SGL Carbon, a graphite producer, the average age of workers has been going up not down. The reason, says the company’s Ivo Lingnau, is not that SGL values older workers more. It is collective bargaining: the union agreement puts strict limits on the proportion of workers that may retire early.

D Clearly, when older people do heavy physical work, their age may affect their productivity. But other skills may increase with age, including many that are crucial for good management, such as an ability to handle people diplomatically, to run a meeting or to spot a problem before it blows up. Peter Hicks, who co-ordinates OECD work on the policy implications of ageing, says that plenty of research suggests older people are paid more because they are worth more.

E And the virtues of the young may be exaggerated. “The few companies that have kept on older workers find they have good judgment and their productivity is good, ” says Mr Peterson. “Besides, their education standards are much better than those of today’s young high-school graduates.” Companies may say that older workers are not worth training, because they are reaching the end of their working lives: in fact, young people tend to switch jobs so frequently that they offer the worst returns on training. “The median age for employer-driven training is the late 40s and early 50s, ” says Mr Hicks. “It goes mainly to managers.”

F Take away those seniority-based pay scales, and older workers may become a much more attractive employment proposition. But most companies (and many workers) are uncomfortable with the idea of reducing someone’s pay in later life - although workers on piece-rates often earn less over time. So retaining the services of older workers may mean employing them in new ways.

G One innovation, described in Mr. Walker’s report on combating age barriers, was devised by IBM Belgium. Faced with the need to cut staff costs, and having decided to concentrate cuts on 55-60-year-olds, IBM set up a separate company called Skill Team, which re-employed any of the early retired who wanted to go on working up to the age of

60. An employee who joined Skill Team at the age of 55 on a five-year contract would work for 58% of his time, over the full period, for 88% of his last IBM salary. The company offered services to IBM, thus allowing it to retain access to some of the intellectual capital it would otherwise have lost.

H The best way to tempt the old to go on working may be to build on such “bridge” jobs: part-time or temporary employment that creates a more gradual transition from full-time work to retirement. Mr Quinn, who has studied the phenomenon, finds that, in the United States, nearly half of all men and women who had been in full-time jobs in middle age moved into such “bridge” jobs at the end of their working lives. In general, it is the best- paid and worst-paid who carry on working: “There are”, he says, “two very different types of bridge job-holders - those who continue working because they have to and those who continue working because they want to, even though they could afford to retire.”

I If the job market grows more flexible, the old may find more jobs that suit them. Often, they will be self-employed. Sometimes, they may start their own businesses: a study by David Storey of Warwick University found that, in Britain, 70% of businesses started by people over 55 survived, compared with an average of only 19%. To coax the old back into the job market, work will not only have to pay. It will need to be more fun than touring the country in an Airstream trailer, or seeing the grandchildren, or playing golf. Only then will there be many more Joe Clarks.

Questions 1-4

Do the following statements agree with the information given in Reading Passage 3?

In boxes 1-4 on your answer sheet, write

TRUE	if the statement is true
FALSE	if the statement is false
NOT GIVEN	if the information is not given in the passage

1. Insurance company Sun Life of Canada made decision that it would hire more Canadian employees rather than British ones in order to get fresh staffs.
2. Unlike other places, employees in Japan get paid according to the years they are employed

3. Elder workers are laid off by some German companies which are refreshing corporate culture
4. According to Peter Hicks, companies pay older people more regardless of the contribution of they make.

Questions 5-6

Choose the correct letter, A, B, C, D, E.

Write your answers in boxes 5-6 on your answer sheet.

According to the passage there are several advantages to hire elder people, please choose **TWO** from below :

- A. their productivity are more superior than the young.
- B. paid less compared with younger ones.
- C. run fast when there is a meeting
- D. have better inter-person relationship
- E. identify problems in an advanced time.

Questions 7-8

Choose the correct letter, A, B, C, D, E.

Write your answers in boxes 7-8 on your answer sheet.

According to Mr. Peterson, Compared with elder employees, young graduates have several weaknesses in workplace, please choose **TWO** of them below :

- A. they are not worth training.
- B. their productivity is lower than counterparts.
- C. they change work more often
- D. their academic criteria is some way behind elders'
- E. they are normally high school graduates.

Questions 9-13

Choose the correct letter, **A, B, C or D.**

Write your answers in boxes 9-13 on your answer sheet.

9 . According to paragraph F , the firms and workers still hold the opinion that:

- A. Older workers are more likely to attract other staff
- B. people are not happy if pay gets lower in retiring age.
- C. Older people have more retaining motivation than young people
- D. young people often earn less for their piece-rates salary.

10. SkillTeam that has been founded by IBM conducted which of following movement:

- A. Ask all the old worker to continue their job on former working hours basis
- B. Carry on the action of cutting off the elder's proportion of employment
- C. Ask employees to work more hours in order to get extra pay
- D. Re-hire old employees and kept the salary a bit lower

11. which of the followings is correct according to the research of Mr Quinn:

- A. About 50% of all employees in America switched into 'Bridge' jobs.
- B. Only the worst-paid continue to work.
- C. More men than women fell into the category of 'bridge' work.
- D. Some old people keep working for their motive rather than economic incentive.

12. Which of the followings is correct according to David Storey:

- A. 70% business are successful if hire more older people.
- B. Average success of self-employed business is getting lower.
- C. Self-employed elder people are more likely to survive.
- D. Older people's working hours are more flexible.

13. What is the main purpose of the author in writing this passage?

- A. there must be a successful retiring program for the old
- B. older people should be correctly valued in employment
- C. old people should offer more helping young employees grow.
- D. There are more jobs in the world that only employ older people

SECTION 2

You should spend about 20 minutes on Questions 14-27, which are based on Reading Passage 2 below.

The history of salt

A Salt is so simple and plentiful that we almost take it for granted. In chemical terms, salt is the combination "of a sodium ion with a chloride ion, making it one of the most basic molecules on earth. It is also one of the most plentiful: it has been estimated that salt deposits under the state of Kansas alone could supply the entire world's needs for the next 250,000 years.

B But salt is also an essential element. Without it, life itself would be impossible since the human body requires the mineral in order to function properly. The concentration of sodium ions in the blood is directly related to the regulation of safe body fluid levels. And while we are all familiar with its many uses in cooking, we may not be aware that this element is used in some 14,000 commercial applications. From manufacturing pulp and paper to setting dyes in textiles and fabric, from producing soaps and detergents to making our roads safe in winter, salt plays an essential part in our daily lives.

C Salt has a long and influential role in world history. From the dawn of civilization, it has been a key factor in economic, religious, social and political development. In every corner of the world, it has been the subject of superstition, folklore, and warfare, and has even been used as currency.

D As a precious and portable commodity, salt has long been a cornerstone of economies throughout history. In fact, researcher M.R. Bloch conjectured that civilization began along the edges of the desert because of the natural surface deposits of salt found there. Bloch also believed that the first war - likely fought near the ancient city of Essalt on the Jordan River - could have been fought over the city's precious supplies of the mineral.

E In 2200 BC, the Chinese emperor Hsia Yu levied one of the first known taxes. He taxed salt. In Tibet, Marco Polo noted that tiny cakes of salt were pressed with images of the Grand Khan to be used as coins and to this day among the nomads of Ethiopia's Danakil Plains it is still used as money. Greek slave traders often bartered it for slaves, giving rise to the expression that someone was "not worth his salt." Roman legionnaires were paid in salt - a *salarium*, the Latin origin of the word "salary."

F Merchants in 12th-century Timbuktu-the gateway to the Sahara Desert and the seat of scholars - valued this mineral as highly as books and gold. In France, Charles of Anjou levied the "gabelle, a salt tax, in 1259 to finance his conquest of the Kingdom of Naples. Outrage over the gabelle fueled the French Revolution. Though the revolutionaries eliminated the tax shortly after Louis XVI, the Republic of France re-established the gabelle in the early 19th Century ; only in 1946 was it removed from the books.

G The Erie Canal, an engineering marvel that connected the Great Lakes to New York's Hudson River in 1825, was called "the ditch that salt built." Salt tax revenues paid for half the cost of construction of the canal. The British monarchy supported itself with high salt taxes, leading to a bustling black market for the white crystal. In 1785, the earl of Dundonald wrote that every year in England, 10,000 people were arrested for salt smuggling. And protesting against British rule in 1930, Mahatma Gandhi led a 200-mile march to the Arabian Ocean to collect untaxed salt for India's poor.

H In religion and culture, salt long held an important place with Greek worshippers consecrating it in their rituals. Further, in Buddhist tradition, salt repels evil spirits, which is why it is customary to throw it over your shoulder before entering your house after a funeral: it scares off any evil spirits that may be clinging to your back. Shinto religion also uses it to purify an area. Before sumo wrestlers enter the ring for a match - which is in reality an elaborate Shinto rite - a handful is thrown into the center to drive off malevolent spirits

I In the Southwest of the United States, the Pueblo worship the Salt Mother. Other

native tribes had significant restrictions on who was permitted to eat salt. Hopi legend holds that the angry Warrior Twins punished mankind by placing valuable salt deposits far from civilization, requiring hard work and bravery to harvest the precious mineral. Today, a gift of salt endures in India as a potent symbol of good luck and a reference to Mahatma Gandhi's liberation of India.

J The effects of salt deficiency are highlighted in times of war, when human bodies and national economies are strained to their limits. Thousands of Napoleon's troops died during the French retreat from Moscow due to inadequate wound healing and lowered resistance to disease - the results of salt deficiency.

Questions 14-16

Choose THREE letters A-H.

Write your answers in boxes 14-16 on your answer sheet. NB Your answers may be given in any order.

Which THREE statements are true of salt?

- A. A number of cities take their name from the word salt.
- B. Salt contributed to the French Revolution.
- C. The uses of salt are countless.
- D. Salt has been produced in China for less than 2000 years.
- E. There are many commercial applications for salt.
- F. Salt deposits in the state of Kansas are vast.
- G. Salt has few industrial uses nowadays.
- H. Slaves used salt as a currency.

Questions 17-21

Complete the summary.

Choose NO MORE THAN TWO WORDS from the passage for each answer. Write your answers in boxes 17-21 on your answer sheet.

Salt is such an 17_____ that people would not be able to live without it. As well as its uses in cooking, this basic mineral has thousands of business 18_____ ranging from making paper to the manufacture of soap. Being a prized and 19_____ it has played a major part in the

economies of many countries. As such, salt has not only led to war, but has also been used to raise 20_____by governments in many parts of the world. There are also many instances of its place in religion and culture, being used as a means to get rid of evil 21_____.

Questions 22-27

Do the following statements agree with the information in Reading Passage 2? In boxes 22-27 on your answer sheet write

TRUE	if the statement agrees with the information
FALSE	if the statement contradicts the information
NOT GIVEN	if there is no information about the statement

- 22. It has been suggested that salt was responsible for the first war.
- 23. The first tax on salt was imposed by a Chinese emperor.
- 24. Salt is no longer used as a form of currency.
- 25. Most of the money for the construction of the Erie Canal came from salt taxes.
- 26. Hopi legend believes that salt deposits were placed far away from civilization to penalize mankind.
- 27. A lack of salt is connected with the deaths of some soldiers.

SECTION 3

Designed to Last

Could better design cure our throwaway culture?

A Jonathan Chapman, a senior lecture at the University of Brighton, UK, is one of a new breed of "sustainable designers". Like many of us, they are concerned about the huge waste associated with Western consumer culture and the damage this does to the environment. Some, like Chapman, aim to create objects we will want to keep rather than discard. Others are working to create more efficient or durable consumer goods, or goods designed with recycling in mind. The waste entailed in our fleeting relationships with consumer durables is colossal

B Domestic power tools, such as electric drills, are a typical example of such waste. However much DIY the purchaser plans to do, the truth is that these things are thrown away having been used, on average, for just ten minutes. Most will serve (conscience time, gathering dust on a shelf in the garage; people are reluctant to admit that they have wasted their money. However, the end is inevitable thousands of years in landfill waste sites. In its design, manufacture, packaging, transportation and disposal, a power tool consumes many times its own weight in resources, all for a shorter active lifespan than that of the average small insect.

C To understand why we have become so wasteful, we should look to the underlying motivation (of consumers. 'People own things to give expression to who they are, and to show what group of people they feel they belong to, ' Chapman says. In a world of mass production, however, that symbolism has lost much of its potency. For most of human history, people had an intimate relationship with objects they used or treasured. Often they made the objects themselves, or family members passed them on. For more specialist objects, people relied on expert manufacturers living close by, whom they probably knew personally. Chapman points out that all these factors gave objects a history - a narrative - and an emotional connection that today's mass production cannot

match. Without these personal connections, consumerist culture instead idolizes novelty

.We know we can't buy happiness, but the chance to remake ourselves with glossy, box- fresh products seems irresistible. When the novelty fades we simply renew the excitement by buying more new stuff: what John Thackara of Doors of Perception, a network for sharing ideas about the future of design, calls the "schlock of the new".

D As a sustainable designer, Chapman's solution is what he calls "emotionally durable design". Think about your favorite old jeans. They just don't have the right feel until they have been worn and washed a hundred times, do they? It is like they are sharing your life story. You can fake that look, but it isn't the same. Chapman says the gradual unfolding of a relationship like this transforms our interactions with objects into something richer than simple utility. Swiss industrial analyst Walter Stahel, visiting professor at the University of Surrey, calls it the "teddy-bear factor". No matter how ragged and worn a favorite teddy becomes, we don't rush out and buy another one. As adults, our teddy bear connects us to our childhoods, and this protects it from obsolescence Stahel says this is what sustainable design needs to do.

E It is not simply about making durable items that people want to keep. Sustainable design is a matter of properly costing the whole process of production, energy use and disposal. "It is about the design of systems, the design of culture." says Tim Cooper from the Centre for Sustainable Consumption at Sheffield Hallam University in Britain. He thinks sustainable design has been "surprisingly slow to take off" but says looming environmental crises and resource depletion are pushing it to the top of the agenda.

F Thackara agrees. For him, the roots of impending environmental collapse can be summarized in two words: weight and speed. We are making more stuff than the planet can sustain and using vast amounts of energy moving more and more of it around ever faster. The Information Age was supposed to lighten our economies and reduce our impact on the environment, but the reverse seems to be happening. We have simply added information technology to the industrial era and hastened the developed world's metabolism, Thackara argues.

G Once you grasp that, the cure is hardly rocket science: minimize waste and energy use, stop moving stuff around so much and use people more. EZIO MANZINI, PROFESSOR of industrial design at Politecnico di Milano university, Italy, describes the process of moving to a post-throwaway society as like "changing the engine of an aircraft in mid-flight". Even so, he believes it can be done, and he is not alone.

H Manzini says a crucial step would be to redesign our globalized world into what he calls the "multi-local society". His vision is that every resource, from food to electricity generation, should as far as possible be sourced and distributed locally. These local hubs would then be connected to national and global networks to allow the most efficient use and flow of materials.

I So what will post-throwaway consumerism look like? For a start, we will increasingly buy sustainably designed products. This might be as simple as installing energy-saving light bulbs, more efficient washing machines, or choosing locally produced groceries with less packaging.

J We will spend less on material goods and more on services. Instead of buying a second car, for example, we might buy into a car-sharing network. We will also buy less and rent a whole lot more: why own things that you hardly use, especially things that are likely to be updated all the time? Consumer durables will be sold with plans already in place for their disposal. Electronic goods will be designed to be recyclable, with the extra cost added to the retail price as prepayment. As consumers become increasingly concerned about the environment, many big businesses are eagerly adopting sustainable design and brushing up their green credentials to please their customers and stay one step ahead of the competition.

You should spend about 20 minutes on question 28-40, which are based on reading passage 3 on the following pages.

Questions 28-32

Choose the correct letter, A, B, C or D.

Write the correct letter in boxes 28-32 on your answer sheet.

28. What does 'conscience time' imply in paragraph 2?

- A. People feel guilty when they throw things away easily.
- B. The shelf in the garage needs cleaning.
- C. The consumers are unaware of the waste problem.
- D. The power tool should be placed in the right place after being used.

29. Prior to the mass production, people own things to show

- A. their quality
- B. their status
- C. their character
- D. their history

30. The word 'narrative' in paragraph 3 refers to

- A. the novelty culture pursued by the customers
- B. the motivation of buying new products
- C. object stories that relate personally and meaningfully to the owners
- D. the image created by the manufacturers

31. Without personal connection, people buy new stuff for

- A. sharing
- B. freshness
- C. collection
- D. family members

32. The writer quotes the old jeans and teddy bear to illustrate that

- A. products are used for simple utility.
- B. producers should create more special stuff to attract the consumers.
- C. Chapman led a poor childhood life.
- D. the emotional connections make us to keep the objects for longer.

Questions 33-36

Complete the summary using the list of words, A-H, below.

Write the correct letter A-H, in boxes 33-36 on your answer sheet.

Tim Cooper claims that although sustainable design proceeds 33.....

, the coming problems are pushing the move. In accordance with Tim Cooper, Thackara believes that the origins of the looming environmental crises are weight and

34 The technology which was assumed to have a positive effect

on our society actually accelerates the world's 35.....To cure this, Manzini proposes a 'multi-local society' which means every resource should be located and redeployed 36.....

A	properly	B	energy	C	locally
D	economy	E	slowly	F	speed
G	quickly	H	metabolism		

Questions 37-40

Do the following statements agree with the claims of the writer in Reading Passage? In boxes 37-40 on your answer sheet, write

YES	if the statement is true
NO	if the statement is false
NOT GIVEN	if the information is not given in the passage

- 37. People often buy things that are seldom used and throw them away.
- 38. In a post-throwaway society, we will pay extra money after disposing the electronic goods.
- 39. Some businesses have jumped on the sustainability bandwagon.
- 40. Company will spend less on repairing in the future.

Reading Test 28

SECTION 1

William Gilbert and Magnetism

A 16th and 17th centuries saw two great pioneers of modern science: Galileo and Gilbert. The impact of their findings is eminent. Gilbert was the first modern scientist, also the accredited father of the science of electricity and magnetism, an Englishman of learning and a physician at the court of Elizabeth. Prior to him, all that was known of electricity and magnetism was what the ancients knew, nothing more than that the lodestone possessed magnetic properties and that amber and jet, when rubbed, would attract bits of paper or other substances of small specific gravity. However, he is less well-known than he deserves.

B Gilbert's birth predated Galileo. Born in an eminent local family in Colchester county in the UK, on May 24, 1544, he went to grammar school, and then studied medicine at St. John's College, Cambridge, graduating in 1573. Later he traveled in the continent and eventually settled down in London.

C He was a very successful and eminent doctor. All this culminated in his election to the president of the Royal Science Society. He was also appointed the personal physician to the Queen (Elizabeth I), and later knighted by the Queen. He faithfully served her until her death. However, he didn't outlive the Queen for long and died on December 10, 1603, only a few months after his appointment as personal physician to King James.

D Gilbert was first interested in chemistry but later changed his focus due to the large portion of mysticism of alchemy involved (such as the transmutation of metal). He gradually developed his interest in physics after the great minds of the ancient, particularly about the knowledge the ancient Greeks had about lodestones, strange minerals with the power to attract iron. In the meantime, Britain became a major seafaring nation in 1588 when the Spanish Armada was defeated, opening the way to

British settlement of America. British ships depended on the magnetic: compass, yet no one understood why it worked. Did the pole star attract it, as Columbus once speculated; or was there a magnetic mountain at the pole, as described in *Odyssey* which ships would never approach, because the sailors thought its pull would yank out all their iron nails and fittings? For nearly 20 years William Gilbert conducted ingenious experiments to understand magnetism. His works include *On the Magnet and Magnetic Bodies, Great Magnet of the Earth*.

E Gilbert's discovery was so important to modern physics. He investigated the nature of magnetism and electricity. He even coined the word "electric". Though the early beliefs of magnetism were also largely entangled with superstitions such as that rubbing garlic on lodestone can neutralize its magnetism, one example being that sailors even believed the smell of garlic would even interfere with the action of compass, which is why helmsmen were forbidden to eat it near a ship's compass. Gilbert also found that metals can be magnetized by rubbing materials such as fur, plastic or the like on them. He named the ends of a magnet "north pole" and "south pole". The magnetic poles can attract or repel, depending on polarity. In addition, however, ordinary iron is always attracted to a magnet. Though he started to study the relationship between magnetism and electricity, sadly he didn't complete it. His research of static electricity using amber and jet only demonstrated that objects with electrical charges can work like magnets attracting small pieces of paper and stuff. It is a French guy named du Fay that discovered that there are actually two electrical charges, positive and negative.

F He also questioned the traditional astronomical beliefs. Though a Copernican, he didn't express in his quintessential beliefs whether the earth is at the center of the universe or in orbit around the sun. However he believed that stars are not equidistant from the earth, but have their own earth-like planets orbiting around them. The earth is itself like a giant magnet, which is also why compasses always point north. They spin on an axis that is aligned with the earth's polarity. He even likened the polarity of the magnet to the polarity of the earth and built an entire magnetic philosophy on this analogy. In his explanation, magnetism was the soul of the earth. Thus a perfectly spherical lodestone, when aligned with the earth's poles, would wobble all by itself in

24 hours. Further, he also believed that suns and other stars wobble just like the earth does around a crystal core, and speculated that the moon might also be a magnet caused to orbit by its magnetic attraction to the earth. This was perhaps the first proposal that a force might cause a heavenly orbit.

G His research method was revolutionary in that he used experiments rather than pure logic and reasoning like the ancient Greek philosophers did. It was a new attitude toward scientific investigation. Until then, scientific experiments were not in fashion. It was because of this scientific attitude, together with his contribution to our knowledge of magnetism, that a unit of magneto motive force, also known as magnetic potential, was named Gilbert in his honor. His approach of careful observation and experimentation rather than the authoritative opinion or deductive philosophy of others had laid the very foundation for modern science.

Questions 1-7

Reading passage 1 has seven paragraphs A-G

Choose the correct heading for each paragraph from the list of headings below. Write the correct number i-x in boxes 1-7 on your answer sheet.

List of Headings
i. Early years of Gilbert
ii. What was new about his scientific research method
iii. The development of chemistry
iv. Questioning traditional astronomy
v. Pioneers of the early science
vi. Professional and social recognition
vii. Becoming the president of the Royal Science Society

The great works of Gilbert

His discovery about magnetism

His change of focus

1. Paragraph A
2. Paragraph B
3. Paragraph C
4. Paragraph D
5. Paragraph E
6. Paragraph F

7. Paragraph G

Questions 8-10

Do the following statements agree with the information given in Reading Passage 1?
In boxes 8-10 on your answer sheet write

TRUE	if the statement is true
FALSE	if the statement is false
NOT GIVEN	if the information is not given in the passage

8. He is less famous than he should be.
9. He was famous as a doctor before he was employed by the Queen
10. He lost faith in the medical theories of his time.

Questions 11-13

Choose THREE letters A-F.

Write your answers in boxes 11-13 on your answer sheet. Which THREE of the following are parts of Gilbert's discovery?

- A. Metal can be transformed into another.
- B. Garlic can remove magnetism.
- C. Metals can be magnetized.
- D. Stars are at different distances from the earth.
- E. The earth wobbles on its axis.
- F. There are two charges of electricity.

SECTION 2

Seed Hunting

A With quarter of the world's plants set to vanish within the next 50 years, Dough Alexander reports on the scientists working against the clock to preserve the Earth's botanical heritage. They travel the four corners of the globe, scouring jungles, forests and savannas. But they're not looking for ancient artefacts, lost treasure or undiscovered tombs. Just pods. It may lack the romantic allure of archaeology, or the whiff of danger that accompanies going after big game, but seed hunting is an increasingly serious business. Some seek seeds for profit—hunters in the employ of biotechnology firms, pharmaceutical companies and private corporations on the lookout for species that will yield the drugs or crops of the future. Others collect to conserve, working to halt the sad slide into extinction facing so many plant species.

B Among the pioneers of this botanical treasure hunt was John Tradescant, an English royal gardener who brought back plants and seeds from his journeys abroad in the early 1600s. Later, the English botanist Sir Joseph Banks who was the first director of the Royal Botanic Gardens at Kew and travelled with Captain James Cook on his voyages near the end of the 18th century—was so driven to expand his collections that he sent botanists around the world at his own expense.

C Those heady days of exploration and discovery may be over, but they have been replaced by a pressing need to preserve our natural history for the future. This modern mission drives hunters such as Dr Michiel van Slageren, a good-natured Dutchman who often sports a wide-brimmed hat in the field—he could easily be mistaken for the cinematic hero Indiana Jones. He and three other seed hunters work at the Millennium Seed Bank, an 80 million [pounds sterling] international conservation project that aims to protect the world's most endangered wild plant species

D The group's headquarters are in a modern glass-and-concrete structure on a 200-hectare Estate at Wakehurst Place in the West Sussex countryside. Within its

underground vaults are 260 million dried seeds from 122 countries, all stored at -20 Celsius to survive for centuries. Among the 5, 100 species represented are virtually all of Britain's 1,400 native seed-bearing plants, the most complete such collection of any country's flora.

E Overseen by the Royal botanic gardens, the Millennium Seed Bank is the world's largest wild-plant depository. It aims to collect 24,000 species by 2010. The reason is simple: thanks to humanity's efforts, an estimated 25 per cent of the world's plants are on the verge of extinction and may vanish within 50 years. We're currently responsible for habitat destruction on an unprecedented scale, and during the past 400 years, plant species extinction rates have been about 70 times greater than those indicated by the geological record as being 'normal'. Experts predict that during the next 50 years a further one billion hectares of wilderness will be converted to farmland in developing countries alone.

F The implications of this loss are enormous. Besides providing staple food crops, plants are a source of many medicines and the principal supply of fuel and building materials in many parts of the world. They also protect soil and help regulate the climate. Yet, across the globe, plant species are being driven to extinction before their potential benefits are discovered.

G The world Conservation Union has listed 5,714 threatened species is sure to be much higher. In the UK alone, 300 wild plant species are classified as endangered. The Millennium Seed Bank aims to ensure that even if a plant becomes extinct in the wild, it won't be lost forever.

Stored seeds can be used to help restore damaged or destroyed environment or in scientific research to find new benefits for society in medicine, agriculture or local industry that would otherwise be lost.

H Seed banks are an insurance policy to protect the world's plant heritage for the future, explains Dr Paul Smith, another Kew seed hunter. "Seed conservation techniques were originally developed by farmers/" he says. "Storage is the basis what we do, conserving

seeds until you can use them just as in farming." Smith says there's no reason why any plant species should become extinct, given today's technology. But he admits that the biggest challenge is finding, naming and categorising all the world's plants. And someone has to gather these seeds before it's too late. "There aren't a lot of people out there doing this," he says" The key is to know the flora from a particular area, and that knowledge takes years to acquire."

I There are about 1,470 seed banks scattered around the globe, with a combined total of 5.4 million samples, of which perhaps two million are distinct non-duplicates. Most preserve genetic material for agriculture use in order to ensure crop diversity; others aim to conserve wild species, although only 15 per cent of all banked plants are wild.

J Imperial College, London, examined crop collections from 151 countries and found that while the number of plant samples had increased in two thirds of the countries, budget had been cut in a quarter and remained static in another 35 per cent. The UN's Food and Agriculture Organization and the Consultative Group on International Agricultural Research has since set up the Global Conservation Trust, which aims to raise US \$260 million to protect seed banks in perpetuity.

Questions 14-19

Do the following statements agree with the information given in Reading Passage 2? In boxes 14-19 on your answer sheet, write

TRUE	if the statement is true
FALSE	if the statement is false
NOT GIVEN	if the information is not given in the passage

- 14. The purpose of collecting seeds now is different from the past
- 15. The millennium seed bank is the earliest seed bank.
- 16. One of major threats for plant species extinction is farmland expansion into wildness.
- 17. The approach that scientists apply to store seeds is similar to that used by farmers.
- 18. technological development is the only hope to save plant species.
- 19. The works of seed conservation are often limited by financial problems.

Questions 20-24

Summary

Complete the following summary of the paragraphs of Reading Passage 2, using no more than three words from the Reading Passage for each answer. Write your answers in boxes 20-24 on your answer sheet.

Some people collect seeds for the purpose of protecting certain species from _____ 20 _____; others collect seeds for their ability to produce _____ 21 _____ . They are called seed hunters.

The _____ 22 _____ of them included both gardeners and botanists
, such as _____ 23 _____, who financially supported collectors out of his own pocket. The seeds collected are usually stored in seed banks, one of which is the famous millennium seed bank, where seeds are all stored in the _____ 24 _____ at a low temperature.

Questions 25-26

Choose the correct letter, A-E.

Write your answers in boxes 25, 26 on your answer sheet.

Which TWO of the followings are provided by plants to the human ?

- A. food
- B. fuels
- C. clothes
- D. energy
- E. commercial products

SECTION 3

The Power of Nothing

Geoff Watts, *New Scientist* (May 26th, 2001)

A Want to devise a new form of alternative medicine? No problem. Here is the recipe. Be warm, sympathetic, reassuring and enthusiastic. Your treatment should involve physical contact, and each session with your patients should last at least half an hour, treatment and understand how their disorders relate to the rest of their lives. Tell them that their own bodies possess the true power to heal. Make them pay you out of their own pockets. Describe your treatment in familiar words, but embroidered with a hint of mysticism: energy fields, energy flows, energy blocks, meridians, forces, auras, rhythms and the like. Refer to the K J knowledge of an earlier age: wisdom carelessly swept aside by the rise and rise of blind, mechanistic science. Oh, come off it, you are saying. Something invented off the top of your head could not possibly work, could it?

B Well yes, it could - and often well enough to earn you living. A good living if you are sufficiently convincing, or better still, really believe in your therapy. Many illnesses get better on their own, so if you are lucky and administer your treatment at just the right time you will get the credit. But that's only part of it. Some of the improvement really would be down to you. Your healing power would be the outcome of a paradoxical force that conventional medicine recognizes but remains oddly ambivalent about: the placebo effect.

C Placebos are treatments that have no direct effect on the body, yet still work because the patient has faith in their power to heal. Most often the term refers to a dummy pill, but it applies just as much to any device or procedure, from a sticking plaster to a crystal to an operation. The existence of the placebo effect implies that even quackery may confer real benefits, which is why any mention of placebo is a touchy subject for many practitioners of complementary and alternative medicine, who are likely to regard it as tantamount to a charge of charlatanism. In fact, the placebo effect is a powerful part of

all medical care, orthodox or otherwise, though its role is often neglected or misunderstood.

D One of the great strengths of CAM may be its practitioners' skill in deploying the placebo effect to accomplish real healing. "Complementary practitioners are miles better at producing non-specific effects and good therapeutic relationships," says Edzard Ernst, professor of CAM at Exeter University. The question is whether CAM could be integrated into conventional medicine, as some would like, without losing much of this power.

E At one level, it should come as no surprise that our state of mind can influence our physiology: anger opens the superficial blood vessels of the face; sadness pumps the tear glands. But exactly how placebos work their medical magic is still largely unknown. Most of the scant research done so far has focused on the control of pain, because it's one of the commonest complaints and lends itself to experimental study. Here, attention has turned to the endorphins, morphine-like neurochemicals known to help control pain.

F But exactly how placebos work their medical magic is still largely unknown. Most of the scant research to date has focused on the control of pain, because it's one of the commonest complaints and lends itself to experimental study. Here, attention has turned to the endorphins, natural counterparts of morphine that are known to help control pain. "Any of the neurochemicals involved in transmitting pain impulses or modulating them might also be involved in generating the placebo response," says Don Price, an oral surgeon at the University of Florida who studies the placebo effect in dental pain.

G "But endorphins are still out in front." That case has been strengthened by the recent work of Fabrizio Benedetti of the University of Turin, who showed that the placebo effect can be abolished by a drug, naloxone, which blocks the effects of endorphins. Benedetti induced pain in human volunteers by inflating a blood-pressure cuff on the forearm. He did this several times a day for several days, using morphine each time to control the pain. On the final day, without saying anything, he replaced the morphine with a saline solution. This still relieved the subjects' pain: a placebo effect. But when he added

naloxone to the saline the pain relief disappeared. Here was direct proof that placebo analgesia is mediated, at least in part, by these natural opiates

H Still, no one knows how belief triggers endorphin release, or why most people can't achieve placebo pain relief simply by willing it. Though scientists don't know exactly how placebos work, they have accumulated a fair bit of knowledge about how to trigger the effect. A London rheumatologist found, for example, that red dummy capsules made more effective painkillers than blue, green or yellow ones. Research on American students revealed that blue pills make better sedatives than pink, a colour more suitable for stimulants. Even branding can make a difference: if Aspro or Tylenol are what you like to take for a headache, their chemically identical generic equivalents may be less effective.

I It matters, too, how the treatment is delivered. Decades ago, when the major tranquilliser chlorpromazine was being introduced, a doctor in Kansas categorised his colleagues according to whether they were keen on it, openly sceptical of its benefits, or took a "let's try and see, ' attitude. His conclusion: the more enthusiastic the doctor, the better the drug performed. And this, year Ernst surveyed published studies that compared doctors' bedside manners. The studies turned up one consistent finding: "Physicians who adopt a warm, friendly and reassuring manner," he reported, "are more effective than those whose consultations are formal and do not offer reassurance"

J Warm, friendly and reassuring are precisely CAM, s strong suits, of course. Many of the ingredients of that opening recipe — the physical contact, the generous swathes of time, the strong hints of supernatural healing power — are just the kind of thing likely to impress patients. It's hardly surprising, then, that complementary practitioners are generally best at mobilising the placebo effect, says Arthur Kleinman, professor of social anthropology at Harvard University.

Questions 27-32

Use the information in the passage to match the deed (listed A-H) with people below. Write the appropriate letters A-H in boxes 27-32 on your answer sheet.

NB you may use any letter more than once

- A. Should easily be understood
- B. should improve by itself
- C. Should not involve any mysticism
- D. Ought to last a minimum length of time.
- E. Needs to be treated at the right time.
- F. Should give more recognition.
- G. Can earn valuable money.
- H. Do not rely on any specific treatment

- 27. Appointments with alternative practitioner
- 28. An alternative practitioners description of treatment
- 29. An alternative practitioner who has faith in what he does
- 30. The illness of patients convinced of alternative practice
- 31. Improvements of patients receiving alternative practice
- 32. Conventional medical doctors (who is aware of placebo)

Questions 33-35

Choose the correct letter, A, B, C or D.

Write your answers in boxes 33-35 on your answer sheet.,

33. In the fifth paragraph, the writer uses the example of anger and sadness to illustrate that:

- A. People's feeling could affect their physical behaviour
- B. Scientists don't understand how the mind influences the body.
- C. Research on the placebo effect is very limited
- D How placebo achieves its effect is yet to be understood.

34. Research on pain control attracts most of the attention because

- A. Scientists have discovered that endorphins can help to reduce pain.

- B. Only a limited number of researchers gain relevant experience
- C. Pain reducing agents might also be involved in placebo effect.
- D. Patients often experience pain and like to complain about it

35. Fabrizio Benedetti's research on endorphins indicates that

- A. They are widely used to regulate pain.
- B. They can be produced by willM thoughts
- C. They can be neutralized by introducing naloxone.
- D. Their pain-relieving effects do not last long enough.

Questions 36-40

Do the following statements agree with the information given in Reading Passage 3?

In boxes 36-40 on your answer sheet, write

TRUE	if the statement is true
FALSE	if the statement is false
NOT GIVEN	if the information is not given in the passage

- 36. There is enough information for scientists to fully understand the placebo effect.
- 37. A London based researcher discovered that red pills should be taken off the market.
- 38. People's preference on brands would also have effect on their healing.
- 39. Medical doctors have a range of views of the newly introduced drug of
- 40. Alternative practitioners are seldom known for applying placebo effect.

Reading Test 29

SECTION 1

Going Bananas

A The world's favourite fruit could disappear forever in 10 years' time. The banana is among the world's oldest crops. Agricultural scientists believe that the first edible banana was discovered around ten thousand years ago. It has been at an evolutionary standstill ever since it was first propagated in the jungles of South-East Asia at the end of the last ice age. Normally the wild banana, a giant jungle herb called *Musa acuminata*, contains a mass of hard seeds that make the fruit virtually inedible. But now and then, hunter-gatherers must have discovered rare mutant plants that produced seed-less, edible fruits. Geneticists now know that the vast majority of these soft-fruited plants resulted from genetic accidents that gave their cells three copies of each chromosome instead of the usual two. This imbalance prevents seeds and pollen from developing normally, rendering the mutant plants sterile. And that is why some scientists believe the world's most popular fruit could be doomed. It lacks the genetic diversity to fight off pests and diseases that are invading the banana plantations of Central America and the small-holdings of Africa and Asia alike.

B In some ways, the banana today resembles the potato before blight brought famine to Ireland a century and a half ago. But "it holds a lesson for other crops, too", says Emile Frison, top banana at the International Network for the Improvement of Banana and Plantain in Montpellier, France. "The state of the banana,, , Frison warns, "can teach a broader lesson the increasing standardisation of food crops round the world is threatening their ability to adapt and survive."

C The first Stone Age plant breeders cultivated these sterile freaks by replanting cuttings from their stems. And the descendants of those original cuttings are the bananas we still eat today. Each is a virtual clone, almost devoid of genetic diversity. And that uniformity makes it ripe for disease like no other crop on Earth. Traditional varieties of sexually reproducing crops have always had a much broader genetic base,

and the genes will recombine in new arrangements in each generation. This gives them much greater flexibility in evolving responses to disease - and far more genetic resources to draw on in the face of an attack. But that advantage is fading fast, as growers increasingly plant the same few, high-yielding varieties. Plant breeders work feverishly to maintain resistance in these standardized crops. Should these efforts falter, yields of even the most productive crop could swiftly crash. "When some pest or disease comes along, severe epidemics can occur, " says Geoff Hawtin, director of the Rome-based International Plant Genetic Resources Institute.

D The banana is an excellent case in point. Until the 1950s, one variety, the Gros Michel, dominated the world's commercial banana business. Found by French botanists in Asia in the 1820s, the Gros Michel was by all accounts a fine banana, richer and sweeter than today's standard banana and without the latter's bitter aftertaste when green. But it was vulnerable to a soil fungus that produced a wilt known as Panama disease. "Once the fungus gets into the soil it remains there for many years. There is nothing farmers can do. Even chemical spraying won't get rid of it, " says Rodomiro Ortiz, director of the International Institute for Tropical Agriculture in Ibadan, Nigeria. So plantation owners played a running game, abandoning infested fields and moving to so "clean" land _ until they ran out of clean land in the 1950s and had to abandon the Gros Michel. Its successor, and still the reigning commercial king, is the Cavendish banana, a 19th-century British discovery from southern China. The Cavendish is resistant to Panama disease and, as a result, it literally saved the international banana industry. During the 1960s, it replaced the Gros Michel on supermarket shelves. If you buy a banana today, it is almost certainly a Cavendish. But even so, it is a minority in the world's banana crop.

E Half a billion people in Asia and Africa depend on bananas. Bananas provide the largest source of calories and are eaten daily. Its name is synonymous with food. But the day of reckoning may be coming for the Cavendish and its indigenous kin. Another fungal disease, black Sigatoka, has become a global epidemic since its first appearance in Fiji in 1963. Left to itself, black Sigatoka which causes brown wounds on leaves and pre-mature fruit ripening - cuts fruit yields by 50 to 70 per cent and

reduces the productive lifetime of banana plants from 30 years to as little as 2 or 3. Commercial growers keep Sigatoka at bay by a massive chemical assault. Forty sprayings of fungicide a year is typical. But despite the fungicides, diseases such as black Sigatoka are getting more and more difficult to control. "As soon as you bring in a new fungicide, they develop resistance", says Frison. "One thing we can be sure of is that the Sigatoka won't lose in this battle." Poor farmers, who cannot afford chemicals, have it even worse. They can do little more than watch their plants die. "Most of the banana fields in Amazonia have already been destroyed by the disease," says Luadir Gasparotto, Brazil's leading banana pathologist with the government research agency EMBRAPA. Production is likely to fall by 70 percent as the disease spreads, he predicts. The only option will be to find a new variety.

F But how? Almost all edible varieties are susceptible to the diseases, so growers cannot simply change to a different banana. With most crops, such a threat would unleash an army of breeders, scouring the world for resistant relatives whose traits they can breed into commercial varieties. Not so with the banana. Because all edible varieties are sterile, bringing in new genetic traits to help cope with pests and diseases is nearly impossible. Nearly, but not totally. Very rarely, a sterile banana will experience a genetic accident that allows an almost normal seed to develop, giving breeders a tiny window for improvement. Breeders at the Honduran Foundation of Agricultural Research have tried to exploit this to create disease-resistant varieties. Further backcrossing with wild bananas yielded a new seedless banana resistant to both black Sigatoka and Panama disease.

G Neither Western supermarket consumers nor peasant growers like the new hybrid. Some accuse it of tasting more like an apple than a banana. Not surprisingly, the majority of plant breeders have till now turned their backs on the banana and got to work on easier plants. And commercial banana companies are now washing their hands of the whole breeding effort, preferring to fund a search for new fungicides instead. "We supported a breeding programme for 40 years, but it wasn't able to develop an alternative to Cavendish. It was very expensive and we got nothing back," says Ronald Romero, head of research at Chiquita, one of the Big Three companies

that dominate the international banana trade.

H Last year, a global consortium of scientists led by Frison announced plans to sequence the banana genome within five years. It would be the first edible fruit to be sequenced. Well, almost edible. The group will actually be sequencing inedible wild bananas from East Asia because many of these are resistant to black Sigatoka. If they can pinpoint the genes that help these wild varieties to resist black Sigatoka, the protective genes could be introduced into laboratory tissue cultures of cells from edible varieties. These could then be propagated into new, resistant plants and passed on to farmers.

I It sounds promising, but the big banana companies have, until now, refused to get involved in GM research for fear of alienating their customers. "Biotechnology is extremely expensive and there are serious questions about consumer acceptance,"¹¹ says David McLaughlin, Chiquita's senior director for environmental affairs. With scant funding from the companies, the banana genome researchers are focusing on the other end of the spectrum. Even if they can identify the crucial genes, they will be a long way from developing new varieties that smallholders will find suitable and affordable. But whatever biotechnology's academic interest, it is the only hope for the banana. Without banana production worldwide will head into a tailspin. We may even see the extinction of the banana as both a lifesaver for hungry and impoverished Africans and as the most popular product on the world's supermarket shelves.

Questions 1-3

Complete the sentences below with **NO MORE THAN THREE WORDS** from the passage.

In boxes 1-3 on your answer sheet, write

Write your answers in boxes 1-3 on your answer sheet

1. Banana was first eaten as a fruit by humans years ago.

2. Banana was first planted in.....
3. Wild banana's taste is adversely affected by its.....

Questions 4-10

Look at the following statements (Questions 4-10) and the list of people below Match each statement with the correct person, A-I.

Write the correct letter: A-I, in boxes 4-10 On your answer sheet. NB You may use any letter more than once.

4. Pest invasion may seriously damage banana industry.
5. The effect of fungal infection in soil is often long-lasting.
6. A commercial manufacturer gave up on breeding bananas for disease resistant
7. Banana disease may develop resistance to chemical sprays.
8. A banana disease has destroyed a large number of banana plantations.
9. Consumers would not accept genetically altered crop.
10. Lessons can be learned from bananas for other crops.

List of People

- A. Rodomiro
- B. David Maclaughlin
- C. Emile Frison
- D. Ronald Romero
- E. Luadir Gasparotto
- F. Geoff Hawtin

Questions 11-13

Do the following statements agree with the information given in Reading Passage 1?

In boxes 11-13 on your answer sheet, write

TRUE	if the statement is true
FALSE	if the statement is false
NOT GIVEN	if the information is not given in the passage

11. Banana is the oldest known fruit

12. Gros Michel is still being used as a commercial product
13. Banana is a main food in some countries

SECTION 2

Computer Provides More Questions Than Answers

A The island of Antikythera lies 18 miles north of Crete, where the Aegean Sea meets the Mediterranean. Currents there can make shipping treacherous and one ship bound for ancient Rome never made it. The ship that sank there was a giant cargo vessel measuring nearly 500 feet long. It came to rest about 200 feet below the surface, where it stayed for more than 2,000 years until divers looking for sponges discovered the wreck a little more than a century ago.

B Inside the hull were a number of bronze and marble statues. From the look of things, the ship seemed to be carrying luxury items, probably made in various Greek islands and bound for wealthy patrons in the growing Roman Empire. The statues were retrieved, along with a lot of other unimportant stuff, and stored. Nine months later, an enterprising archaeologist cleared off a layer of organic material from one of the pieces of junk and found that it looked like a gearwheel. It had inscriptions in Greek characters and seemed to have something to do with astronomy.

C That piece of “Junk” went on to become the most celebrated find from the shipwreck; it is displayed at the National Archaeological Museum of Athens. Research has shown that the wheel was part of a device so sophisticated that its complexity would not be matched for a thousand years — it was also the world's first known analog computer. The device is so famous that an international conference organized in Athens a couple of weeks ago had only one subject: the Antikythera Mechanism.

D Every discovery about the device has raised new questions. Who built the device, and for what purpose? Why did the technology behind it disappear for the next thousand years? What does the device tell us about ancient Greek culture? And does the marvelous construction, and the precise knowledge of the movement of the sun and moon and Earth that it implies, tell us how the ancients grappled with ideas about determinism and human destiny?

E "We have gear trains from the 9th century in Baghdad used for simpler displays of the solar and lunar motions relative to one another — they use eight gears,' said Francois Charette, a historian of science in Germany who wrote an editorial accompanying a new study of the mechanism two weeks ago in the journal Nature. "In this case, we have more than 30 gears. To see it on a computer animation makes it mind-boggling. There is no doubt it was a technological masterpiece."

F The device was probably built between 100 and 140 BC, and the understanding of astronomy it displays seems to have been based on knowledge developed by the Babylonians around 300-700 BC, said Mike Edmunds, a professor of astrophysics at Cardiff University in Britain. He led a research team that reconstructed what the gear mechanism would have looked like by using advanced three- dimensional-imaging technology. The group also decoded a number of the inscriptions. The mechanism explores the relationship between lunar months_the time it takes for the moon to cycle through its phases, say, full moon to full moon -and calendar years. The gears had to be cut precisely to reflect this complex relationship; 19 calendar years equal 235 lunar months.

G By turning the gear mechanism, which included what Edmunds called a beautiful system of epicyclic gears that factored in the elliptical orbit of the moon, a person could check what the sky would have looked like on a date in the past, or how it would appear in the future. The mechanism was encased in a box with doors in front and back covered with inscriptions -- a sort of instruction manual. Inside the front door were pointers indicating the date and the position of the sun, moon and zodiac, while opening the back door revealed the relationship between calendar years and lunar months, and a mechanism to predict eclipses.

H "If they needed to know when eclipses would occur, and this related to the rising and setting of stars and related them to dates and religious experiences, the mechanism would directly help, " said Yanis Bitsakis, a physicist at the University of Athens who co- wrote the Nature paper. "It is a mechanical computer. You turn the handle and you have a date on the front." Building it would have been expensive and required the

interaction of astronomer, engineers, intellectuals and craftspeople. Charette said the device overturned conventional ideas that the ancient Greeks were primarily ivory tower thinkers who did not deign to muddy their hands with technical stuff. It is a reminder, he said, that while the study of history often focuses on written texts, they can tell us only a fraction of what went on at a particular time.

I Imagine a future historian encountering philosophy texts written in our time ~ and an aircraft engine. The books would tell that researcher what a few scholars were thinking today, but the engine would give them a far better window into how technology influenced our everyday lives. Charette said it was unlikely that the device was used by practitioners of astrology, then still in its infancy. More likely, he said, it was bound for a mantelpiece in some rich Roman's home. Given that astronomers of the time already knew how to calculate the positions of the sun and the moon and to predict eclipses without the device, it would have been the equivalent of a device built for a planetarium today_ something to spur popular interest, or at least claim bragging rights.

J Why was the technology that went into the device lost? "The time this was built, the jackboot of Rome was coming through, "Edmunds said. "The Romans were good at town planning and sanitation but were not known for their interest in science." The fact that the device was so complex, and that it was being shipped with a quantity of other luxury items, tells Edmunds that it is very unlikely to have been the on ever made. Its sophistication "is such that it can't have been the only one, " Edmunds said. "There must have been a tradition of making them. We're always hopeful a better one will surface." Indeed, he said, he hopes that his study and the renewed interest in the Antikythera Mechanism will prompt second looks by both amateurs and professionals around the world. "The archaeological world may look in their cupboards and maybe say, "That isn't a bit of rusty old metal in the cupboard."

Questions 14-18

The reading Passage has ten paragraphs A- J. Which paragraph contains the following information?

Write the correct letter A-J, in boxes 14-18 on your answer sheet.

14. Content inside the wreck ship
15. Ancient astronomers and craftsman might involve
16. The location of Antikythera Mechanism
17. Details of how it was found
18. Appearance and structure of the mechanism

Questions 19-22

Summary

Complete the following summary of the paragraphs of Reading Passage, using **no more than two** words from the Reading Passage for each answer. Write your answers in boxes 19-22 on your answer sheet.

An ancient huge sunk _____ 19 _____ was found accidentally by
sponges
searcher. The ship 20 _____ such as bronze and
loaded
with _____
sculptures. However, an archaeologist found a junk similar to a _____ 21
_____ which has Greek script on it. This inspiring and elaborated device was
found to be the first _____ 22 _____ in the world.

Questions 23-26

Use the information in the passage to match the people (listed A-C) with opinions or deeds below. Write the appropriate letters A-F in boxes 23-27 on your answer sheet.

NB you may use any letter more than once

- A. Yanis Bitsakis
- B. Mike Edmunds
- C. Francois Charette

23. More complicated than previous device

24. Anticipate to find more Antikythera Mechanism in the future
25. Antikythera Mechanism was found related to moon
26. Mechanism assisted ancient people to calculate movement of stars.

SECTION 3

Save Endangered Language

"Obviously we must do some serious rethinking of our priorities, lest linguistics go down in history as the only science that presided obviously over the disappearance of 90 percent of the very field to which it is dedicated." - Michael Krauss, "The World's Languages in Crisis".

A Ten years ago Michael Krauss sent a shudder through the discipline of linguistics with his prediction that half the 6,000 or so languages spoken in the world would cease to be uttered within a century.

Unless scientists and community leaders directed a worldwide effort to stabilize the decline of local languages, he warned, nine tenths of the linguistic diversity of humankind would probably be doomed to extinction. Krauss's prediction was little more than an educated guess, but other respected linguists had been clanging out similar alarms. Keneth L. Hale of the Massachusetts Institute of Technology noted in the same journal issue that eight languages on which he had done fieldwork had since passed into extinction. A 1990 survey in Australia found that 70 of the 90 surviving Aboriginal languages were no longer used regularly by all age groups. The same was true for all but 20 of the 175 Native American languages spoken or remembered in the US, Krauss told a congressional panel in 1992.

B Many experts in the field mourn the loss of rare languages, for several reasons. To start, there is scientific self-interest: some of the most basic questions in linguistics have to do with the limits of human speech, which are far from fully explored. Many researchers would like to know which structural elements of grammar and vocabulary—if any are truly universal and probably therefore hardwired into the human brain. Other scientists try to reconstruct ancient migration patterns by comparing borrowed words that appear in otherwise unrelated languages. In each of these cases, the wider the portfolio of languages you study, the more likely you are to get the right answers.

C Despite the near constant buzz in linguistics about endangered languages over the past 10 years, the field has accomplished depressingly little. “You would think that there would be some organized response to this dire situation”, some attempt to determine which language can be saved and which should be documented before they disappear, says Sarah G. Thomason, a linguist at the University of Michigan at Ann Arbor. “But there isn’t any such effort organized in the profession. It is only recently that it has become fashionable enough to work on endangered languages.⁵⁵ Six years ago, recalls Douglas H. Whalen of Yale University, “when I asked linguists who was raising money to deal with these problems, I mostly got blank stares.” So Whalen and a few other linguists founded the Endangered Languages Fund. In the five years to 2001 they were able to collect only \$80,000 for research grants. A similar foundation in England, directed by Nicholas Ostler, has raised just \$8,000 since 1995.

D But there are encouraging signs that the field has turned a corner. The Volkswagen Foundation, a German charity, just issued its second round of grants totaling more than \$2 million. It has created a multimedia archive at the Max Planck Institute for Psycholinguistics in the Netherlands that can house recordings, grammars, dictionaries and other data on endangered languages. To fill the archive, the foundation has dispatched field linguists to document Aweti (100 or so speakers in Brazil), Ega (about 300 speakers in Ivory Coast), Waimaa (a few hundred speakers in East Timor), and a dozen or so other languages unlikely to survive the century. The Ford Foundation has also edged into the arena. Its contributions helped to reinvigorate a master-apprentice program created in 1992 by Leanne Hinton of Berkeley and Native Americans worried about the imminent demise of about 50 indigenous languages in California. Fluent speakers receive \$3,000 to teach a younger relative (who is also paid) their native tongue through 360 hours of shared activities, spread over six months. So far about 5 teams have completed the program, Hinton says, transmitting at least some knowledge of 25 languages. “It’s too early to call this language revitalization,” Hinton admits. “In California the death rate of elderly speakers will always be greater than the recruitment rate of young speakers. But at least we prolong the survival of the language.” That will give linguists more time to record these tongues before they vanish.

E But the master-apprentice approach hasn't caught on outside the U.S., and Hinton's effort is a drop in the sea. At least 440 languages have been reduced to a mere handful of elders, according to the Ethnologue, a catalogue of languages produced by the Dallas-based group SIL International that comes closest to global coverage. For the vast majority of these languages, there is little or no record of their grammar, vocabulary, pronunciation or use in daily life. Even if a language has been fully documented, all that remains once it vanishes from active use is a fossil skeleton, a scattering of features that the scientist was lucky and astute enough to capture. Linguists may be able to sketch an outline of the forgotten language and fix its place on the evolutionary tree, but little more. "How did people start conversations and talk to babies? How did husbands and wives converse?" Hinton asks. "Those are the first things you want to learn when you want to revitalize the language.

F But there is as yet no discipline of "conservation linguistics" as there is for biology. Almost every strategy tried so far has succeeded in some places but failed in others, and there seems to be no way to predict with certainty what will work where. Twenty years ago in New Zealand, Maori speakers set up "language nests, "in which preschoolers were immersed in the native language. Additional Maori-only classes were added as the children progressed through elementary and secondary school. A similar approach was tried in Hawaii, with some success - the number of native speakers has stabilized at 1,000 or so, reports Joseph E. Grimes of SIL International, who is working on Oahu. Students can now get instruction in Hawaiian all the way through university.

G One factor that always seems to occur in the demise of a language is that the speakers begin to have collective doubts about the usefulness of language loyalty. Once they start regarding their own language as inferior to the majority language, people stop using it for all situations. Kids pick up on the attitude and prefer the dominant language. In many cases, people don't notice until they suddenly realize that their kids never speak the language, even at home. This is how Cornish and some dialects of Scottish Gaelic is still only rarely used for daily home life in Ireland, 80 years after the republic was founded with Irish as its first official language.

H Linguists agree that ultimately, the answer to the problem of language extinction is multilingualism. Even uneducated people can learn several languages, as long as they start as children. Indeed, most people in the world speak more than one tongue, and in places such as Cameroon (279 languages), Papua New Guinea (823) and India (387) it is common to speak three or four distinct languages and a dialect or two as well. Most Americans and Canadians, to the west of Quebec, have a gut reaction that anyone speaking another language in front of them is committing an immoral act. You get the same reaction in Australia and Russia. It is no coincidence that these are the areas where languages are disappearing the fastest. The first step in saving dying languages is to persuade the world's majorities to allow the minorities among them to speak with their own voices.

Questions 27-33

The reading passage has eight paragraphs, A-H

Choose the correct heading for paragraphs A-H from the list below. Write the correct number, i – xi, in boxes 27-33 on your answer sheet.

List of Headings

- i. data consistency needed for language
- ii. consensus on an initiative recommendation for saving dying out languages
- iii. positive gains for protection
- iv. minimum requirement for saving a language
- v. Potential threat to minority language
- vi. a period when there was absent of real effort made.
- vii. native language programs launched
- viii. Lack in confidence in young speakers as a negative factor
- ix. Practise in several developing countries
- x. Value of minority language to linguists.
- xi. government participation in language field

27. Paragraph A
28. Paragraph B
29. Paragraph D
30. Paragraph E

- 31. Paragraph F
- 32. Paragraph G
- 33. Paragraph H

Example: Paragraph C

Questions 34-38

Use the information in the passage to match the people (listed A-F) with opinions or deeds below. Write the appropriate letters A-F in boxes 34-38 on your answer sheet.

- A. Nicholas Ostler
- B. Michael Krauss
- C. Joseph E. Grimes
- D. Sarah
- E. Keneth L. Hale
- F. Douglas
- G. Thomason
- H. Whalen

- 34. Reported language conservation practice in Hawaii
- 35. Predicted that many languages would disappear soon
- 36. Experienced process that languages die out personally
- 37. Raised language fund in England
- 38. Not enough effort on saving until recent work

Questions 39-40

Choose the correct letter, A, B, C or D.

Write your answers in boxes 39-40 on your answer sheet.

39. What is real result of master-apprentice program sponsored by The Ford Foundation!

- A. Teach children how to speak
- B. Revive some endangered languages in California
- C. postpone the dying date for some endangered languages
- D Increase communication between students

40. What should majority language speakers do according to the last paragraph?

- A. They should teach their children endangered language in free lessons

- B. They should learn at least four languages
- C. They should show their loyalty to a dying language
- D. They should be more tolerant to minority language speaker

Reading Test 30

SECTION 1

Eco-Resort Management Practices

A

Ecotourism is often regarded as a form of nature-based tourism and has become an important alternative source of tourists. In addition to providing the traditional resort-leisure product, it has been argued that ecotourism resort management should have a particular focus on best-practice environmental management, an educational and interpretive component, and direct and indirect contributions to the conservation of the natural and cultural environment (Ayala, 1996).

B

Couran Cove Island Resort is a large integrated ecotourism-based resort located south of Brisbane on the Gold Coast, Queensland, and Australia. As the world's population becomes increasingly urbanised, the demand for tourist attractions which are environmentally friendly, serene and offer amenities of a unique nature, has grown rapidly. Couran Cove Resort, which is one such tourist attractions, is located on South Stradbroke Island, occupying approximately 150 hectares of the island. South Stradbroke Island is separated from the mainland by the Broadwater, a stretch of sea 3 kilometers wide. More than a century ago, there was only one Stradbroke Island, and there were at least four aboriginal tribes living and hunting on the island. Regrettably, most of the original island dwellers were eventually killed by diseases such as tuberculosis, smallpox and influenza by the end of the 19th century. The second shipwreck on the island in 1894, and the subsequent destruction of the ship (the *Cambus Wallace*) because it contained dynamite, caused a large crater in the sandhills on Stradbroke Island. Eventually, the ocean broke through the weakened land form and Stradbroke became two islands. Couran Cove Island Resort is built on one of the world's few naturally-occurring sand lands, which is home to a wide range of plant communities and one of the largest remaining remnants of the rare *livistona* Rainforest

left on the Gold Coast. Many mangrove and rainforest areas and Malaleuca Wetlands on South Stradbroke Island (and in Queensland), have been cleared, drained or filled for residential, industrial, agricultural or urban development in the first half of the 20th century. Farmers and graziers finally abandoned South Stradbroke Island in 1939 because the vegetation and the soil conditions there were not suitable for agricultural activities.

SUSTAINABLE PRACTICES OF COURAN COVE RESORT

Being located on an offshore island, the resort is only accessible by means of water transportation. The resort provides hourly ferry service from the marina on the mainland to and from the island. Within the resort, transport modes include walking trails, bicycle tracks and the beach train.

The reception area is the counter of the shop which has not changed in 8 years at least. The accommodation is an octagonal "Bure". These are large rooms that are clean but! The equipment is tired and in some cases just working. Our ceiling fan only worked on high speed for example. Beds are hard but clean, there is television, radio, an old air conditioner and a small fridge. These "Bures" are right on top of each other and night noises do carry so be careful what you say and do. The only thing is the mosquitos but if you forget to bring mosquito repellent they sell some on the island.

As an ecotourism-based resort, most of the planning and development of the attraction has been concentrated on the need to co-exist with the fragile natural environment of South Stradbroke Island to achieve sustainable development.

WATER AND ENERGY MANAGEMENT

C

South Stradbroke Island has groundwater at the centre of the island, which has a maximum height of 3 metres above sea level. The water supply is recharged by rainfall and is commonly known as an unconfined freshwater aquifer (StK/1-) . Couran Cove Island Resort obtains its water supply by tapping into this aquifer and extracting it via a bore system. Some of the problems which have threatened the island's freshwater

supply include pollution, contamination and over-consumption. In order to minimise some of these problems, all laundry activities are carried out on the mainland. The resort considers washing machines as onerous to the island's freshwater supply, and that the detergents contain a high level of phosphates which are a major source of water pollution. The resort uses LPG-power generation rather than a diesel-powered plant for its energy supply, supplemented by wind turbine, which has reduced greenhouse emissions by 70% of diesel-equivalent generation methods. Excess heat recovered from the generator is used to heat the swimming pool. Hot water in the eco-cabins and for some of the resort's vehicles are solar-powered. Water efficient fittings are also installed in showers and toilets. However, not all the appliances used by the resort are energy efficient, such as refrigerators. Visitors who stay at the resort are encouraged to monitor their water and energy usage via the in-house television systems, and are rewarded with prizes (such as a free return trip to the resort) accordingly if their usage level is low.

CONCLUDING REMARKS

D

We examined a case study of good management practice and a pro-active sustainable tourism stance of an eco-resort. In three years of operation, Couran Cove Island Resort has won 23 international and national awards, including the 2001 Australian Tourism Award in the 4-Star Accommodation category. The resort has embraced and has effectively implemented contemporary environmental management practices. It has been argued that the successful implementation of the principles of sustainability should promote long-term social, economic and environmental benefits, while ensuring and enhancing the prospects of continued viability for the tourism enterprise. Couran Cove Island Resort does not conform to the characteristics of the Resort Development Spectrum, as proposed by Prideaux (2000). According to Prideaux, the resort should be at least at Phase 3 of the model (the National tourism phase), which describes an integrated resort providing 3-4 star hotel-type accommodation. The primary tourist market in Phase 3 of the model consists mainly of interstate visitors. However, the number of interstate and international tourists visiting the resort is small,

with the principal locals and residents from nearby towns and the Gold Coast region. The carrying capacity of Couran Cove does not seem to be of any concern to the Resort management. Given that it is a private commercial ecotourist enterprise, regulating the number of visitors to the resort to minimize damage done to the natural environment on South Stradbroke Island is not a binding constraint. However, the Resort's growth will eventually be constrained by its carrying capacity, and quantity control should be incorporated in the management strategy of the resort.

Question 1 - 4.

Choose the correct letter, A, B, C or D. Write your answers in boxes 1 -4 on your answer sheet.

1. the Stradbroke became two islands

- A. by an intended destruction of the ship of the Cambus Wallace
- B. by an explosion of dynamite on a ship and following nature erosion
- C. by the movement sandhills on Stradbroke Island
- D. by the volcanic eruption on island

2. Why are laundry activities for the resort carried out on the mainland.

- A. In order to obtain its water supply via a bore system
- B. In order to preserve the water and anti-pollution
- C. In order to save the cost of installing onerous washing machines
- D. In order to reduce the level of phosphates in water around

3. What is the major water supplier in South Stradbroke Island is by

- A. desalining the sea water
- B. collecting the rainfall
- C. transporting from the mainland
- D. boring ground water

4. What is applied for heating water on Couran Cove Island Resort

- A. the LPG-power
- B. a diesel-powered plant
- C. the wind power
- D the solar-power

5. what does, as the managers of resorts believe, the prospective future focus on

- A. more awards of for resort's accommodation
- B. sustainable administration and development in a long run
- C. Economic and environmental benefits for the tourism enterprise
- D successful implementation the Resort Development Spectrum

Questions 6-10

Complete the following summary of the paragraphs of Reading Passage, using no more than two words from the Reading Passage for each answer. Write your answers in boxes 6-10 on your answer sheet.

Being located away from the mainland, tourists can attain the resort only by 6..... in a regular service. Within the resort, transports include trails for walking or tracks for both 7 and the beach train. The on-island equipment is old-fashioned which is barely working such as the 8..... overhead. There is television, radio, an old 9..... and a small fridge. And you can buy the repellent for 10 if you forget to bring some.

Questions 11-13

Choose three correct letters among A-E

Write your answers in boxes 11-13 on your answer sheet.

What is true as to the contemporary situation of Couran Cove Island Resort in the last paragraph?

- A. Couran Cove Island Resort goes for more eco-friendly practices
- B. the accommodation standard only conforms to the Resort Development Spectrum of Phase 3
- C. Couran Cove Island Resort should raise the accommodation build more standard and build more facilities
- D. the principal group visiting the resort is international tourists
- E. its carrying capacity will restrict the future business' expansion

SECTION 2

You should spend about 20 minutes on question 14-26, which are based on reading passage 2 on the following pages.

TV Addiction

A The amount of time people spend watching television is astonishing. On average, individuals in the industrialized world devote three hours a day to the pursuit —fully half of their leisure time, and more than on any single activity save work and sleep. At this rate, someone who lives to 75 would spend nine years in front of the tube. To some commentators, this devotion means simply that people enjoy TV and make a conscious decision to watch it. But if that is the whole story, why do so many people experience misgivings about how much they view? In Gallup polls in 1992 and 1999, two out of five adult respondents and seven out of 10 teenagers said they spent too much time watching TV. Other surveys have consistently shown that roughly 10 percent of adults call themselves TV addicts

B To study people's reactions to TV, researchers have experiments in which they have monitored the brain waves (using an electroencephalograph, or EEG) to track behavior and emotion in the normal course of life, as opposed to the artificial conditions of the lab. Participants carried a beeper, and we signaled them six to eight times a day, at random, over the period of a week; whenever they heard the beep, they wrote down what they were doing and how they were feeling using a standardized scorecard.

C As one might expect, people who were watching TV when we beeped them reported feeling relaxed and passive. The EEG studies similarly show less mental stimulation, as measured by alpha brain-wave production, during viewing than during reading. What is more surprising is that the sense of relaxation ends when the set is turned off, but the feelings of passivity and lowered alertness continue. Survey participants say they have more difficulty concentrating after viewing than before. In contrast, they rarely indicate such difficulty after reading. After playing sports or engaging in hobbies, people

report improvements in mood. After watching TV, people's moods are about the same or worse than before. That may be because viewers' vague learned sense that they will feel less relaxed if they stop viewing. So they tend not to turn the set off. Viewing begets more viewing which is the same as the experience of habit-forming drugs. Thus, the irony of TV: people watch a great deal longer than they plan to, even though prolonged viewing is less rewarding. In our ESM studies the longer people sat in front of the set, the less satisfaction they said they derived from it. For some, a twinge of unease or guilt that they aren't doing something more productive may also accompany and depreciate the enjoyment of prolonged viewing. Researchers in Japan, the U.K. and the U.S. have found that this guilt occurs much more among middle-class viewers than among less affluent ones.

D What is it about TV that has such a hold on us? In part, the attraction seems to spring from our biological 'orienting response/ First described by Ivan Pavlov in 1927, the orienting response is our instinctive visual or auditory reaction to any sudden or novel stimulus. It is part of our evolutionary heritage, a built-in sensitivity to movement and potential predatory threats. In 1986 Byron Reeves of Stanford University, Esther Thorson of the University of Missouri and their colleagues began to study whether the simple formal features of television—cuts, edits, zooms, pans, sudden noises — activate the orienting response, thereby keeping attention on the screen. By watching how brain waves were affected by formal features, the researchers concluded that these stylistic tricks can indeed trigger involuntary responses and 'derive their attentional value through the evolutionary significance of detecting movement. It is the form, not the content, of television that is unique.

E The natural attraction to television's sound and light starts very early in life. Dafna Lemish of Tel Aviv University has described babies at six to eight weeks attending to television. We have observed slightly older infants who, when lying on their backs on the floor, crane their necks around 180 degrees to catch what light through yonder window breaks. This inclination suggests how deeply rooted the orienting response is.

F The Experience Sampling Method permitted us to look closely at most every domain

of everyday life: working, eating, reading, talking to friends, playing a sport, and so on. We found that heavy viewers report feeling significantly more anxious and less happy than light viewers do in unstructured situations, such as doing nothing, daydreaming or waiting in line. The difference widens when the viewer is alone. Subsequently, Robert D. McIlwraith of the University of Manitoba extensively studied those who called themselves TV addicts on surveys. On a measure called the Short Imaginal Processes Inventory (SIPI), he found that the self-described addicts are more easily bored and distracted and have poorer attentional control than the non-addicts. The addicts said they used TV to distract themselves from unpleasant thoughts and to fill time. Other studies over the years have shown that heavy viewers are less likely to participate in community activities and sports and are more likely to be obese than moderate viewers or non-viewers.

G More than 25 years ago psychologist Tannis M. MacBeth Williams of the University of British Columbia studied a mountain community that had no television until cable finally arrived. Over time, both adults and children in the town became less creative in problem solving, less able to persevere at tasks, and less tolerant of unstructured time.

H Nearly 40 years ago Gary A. Steiner of the University of Chicago collected fascinating individual accounts of families whose set had broken. In experiments, families have volunteered or been paid to stop viewing, typically for a week or a month. Some fought, verbally and physically. In a review of these cold-turkey studies, Charles Winick of the City University of New York concluded: 'The first three or four days for most persons were the worst, even in many homes where viewing was minimal and where there were other ongoing activities. In over half of all the households, during these first few days of loss, the regular routines were disrupted, family members had difficulties in dealing with the newly available time, anxiety and aggressions were expressed. By the second week, a move toward adaptation to the situation was common.' Unfortunately, researchers have yet to flesh out these anecdotes; no one has systematically gathered statistics on the prevalence of these withdrawal symptoms.

I Even though TV does seem to meet the criteria for substance dependence, not all researchers would go so far as to call TV addictive. McIlwraith said in 1998 that

'displacement of other activities by television may be socially significant but still fall short of the clinical requirement of significant impairment.' He argued that a new category of 'TV addiction' may not be necessary if heavy viewing stems from conditions such as depression and social phobia. Nevertheless, whether or not we formally diagnose someone as TV-dependent, millions of people sense that they cannot readily control the amount of television they watch.

Questions 14-18

Do the following statements agree with the claims of the writer in Reading Passage? In boxes 14-18 on your answer sheet, write

TRUE if the statement is true

FALSE if the statement is false

NOT GIVEN if the information is not given in the passage

14. Study shows that males are more likely to be addicted to TV than females.
15. Greater improvements in mood are experienced after watching TV than playing sports.
16. TV addiction works in similar ways as drugs.
17. It is reported that people's satisfaction is in proportion to the time they spend watching TV.
18. Middle-class viewers are more likely to feel guilty about watching TV than the poor.

Questions 19-23

Look at the following researchers (Questions 19-23) and the list of statements below.

Match each researcher with the correct statements.

Write the correct letter A-H in boxes 19-23 on your answer sheets.

19. Byron Reeves and Esther Thorson
20. Dafna Lemish
21. Robert D. McIlwraith
22. Tannis M. MacBeth Williams
23. Charles Winick

List of Statements

- A. Audiences would get hypnotized from viewing too much television.
- B. People have been sensitive to the TV signals since a younger age.
- C. People are less likely to accomplish their work with television.
- D. A handful of studies have attempted to study other types of media addiction.
- E. The addictive power of television could probably minimize the problems.
- F. Various media formal characters stimulate people's reaction on the screen.
- G. People who believe themselves to be TV addicts are less likely to join in the group activities.
- H. It is hard for people to accept the life without TV at the beginning.

Questions 24-26

Choose the correct letter, A, B, C or D.

Write the correct letter in boxes 24-26 on your answer sheet. 24 People in the industrialized world

- A. devote ten hours watching TV on average.
- B. spend more time on TV than other entertainment.
- C. call themselves TV addicts.
- D. working best.

25 When compared with light viewers, heavy viewers

- A. like playing sport more than reading.
- B. feel relaxed after watching TV.
- C. spend more time in daydreaming.
- D. are more easily bored while waiting in line.

26 Which of the following statements is true about the family experiment?

- A. Not all the subjects participate in the experiment for free.
- B. There has been a complete gathered data.
- C. People are prevented from other activities during the experiment.
- D. People cannot adapt to the situation until the end

SECTION 3

Music: Language We All Speak

Section A: Music is one of the human specie's relatively few universal abilities. Without formal training, any individual, from Stone Age tribesman to suburban teenager has the ability to recognize music and, in some fashion, to make it. Why this should be so is a mystery. After all, music isn't necessary for getting through the day, and if it aids in reproduction, it does so only in highly indirect ways. Language, by contrast, is also everywhere- but for reasons that are more obvious. With language, you and the members of your tribe can organize a migration across Africa, build reed boats and cross the seas, and communicate at night even when you can't see each other. Modern culture, in all its technological extravagance, springs directly from the human talent for manipulating symbols and syntax. Scientists have always been intrigued by the connection between music and language. Yet over the years, words and melody have acquired a vastly different status in the lab and the seminar room. While language has long been considered essential to unlocking the mechanisms of human intelligence, music is generally treated as an evolutionary frippery- mere "auditory cheesecake," as the Harvard cognitive scientist Steven Pinker puts it.

Section B: But thanks to a decade-long wave of neuroscience research, that tune is changing. A flurry of recent publications suggests that language and music may equally be able to tell us who we are and where we're from - not just emotionally, but biologically. In July, the journal *Nature Neuroscience* devoted a special issue to the topic. And in an article in the August 6 issue of the *Journal of Neuroscience*, David Schwartz, Catherine Howe, and Dale Purves of Duke University argued that the sounds of music and the sounds of language are intricately connected. To grasp the originality of this idea, it's necessary to realize two things about how music has traditionally been understood. First, musicologists have long emphasized that while each culture stamps a special identity onto its music; music itself has some universal qualities. For example, in virtually all cultures sound is divided into some or all of the 12 intervals that make up the chromatic scale - that is, the scale represented by the keys on a piano. For centuries, observers have attributed this preference for certain combinations of tones to the mathematical properties of sound itself. Some 2,500 years ago, Pythagoras was the first to note a direct relationship between the harmoniousness of a tone combination

and the physical dimensions of the object that produced it. For example, a plucked string will always play an octave lower than a similar string half its size, and a fifth lower than a similar string two-thirds its length. This link between simple ratios and harmony has influenced music theory ever since.

Section C: This music-is-moth idea is often accompanied by the notion that music formally speaking at least, exists apart from the world in which it was created. Writing recently in *The New York Review of Books*, pianist and critic Charles Rosen discussed the long-standing notion that while painting and sculpture reproduce at least some aspects of the natural world, and writing describes thoughts and feelings we are all familiar with, music is entirely abstracted from the world in which we live. Neither idea is right, according to David Schwartz and his colleagues. Human musical preferences are fundamentally shaped not by elegant algorithms or ratios but by the messy sounds of real life, and of speech in particular -which in turn is shaped by our evolutionary heritage." The explanation of music, like the explanation of any product of the mind, must be rooted in biology, not in numbers per se," says Schwartz.

Schwartz, Howe, and Purves analyzed a vast selection of speech sounds from a variety of languages to reveal the underlying patterns common to all utterances. In order to focus only on the raw sound, they discarded all theories about speech and meaning and sliced sentences into random bites. Using a database of over 100,000 brief segments of speech, they noted which frequency had the greatest emphasis in each sound. The resulting set of frequencies, they discovered, corresponded closely to the chromatic scale. In short, the building blocks of music are to be found in speech

Far from being abstract, music presents a strange analog to the patterns created by the sounds of speech. "Music, like the visual arts, is rooted in our experience of the natural world," says Schwartz. "It emulates our sound environment in the way that visual arts emulate the visual environment. " In music we hear the echo of our basic sound-making instrument- the vocal tract. The explanation for human music is simple; still than Pythagoras's mathematical equations. We like the sounds that are familiar to us- specifically, we like sounds that remind us of us.

This brings up some chicken-or-egg evolutionary questions. It may be that music imitates speech directly, the researchers say, in which case it would seem that language evolved first. It's also conceivable that music came first and language is in effect an Imitation of song - that in everyday speech we hit the musical notes we especially like. Alternately, it may be that music imitates the general products of the human sound-making system, which just happens to be mostly speech. "We can't know this," says Schwartz. "What we do know is that they both come from the same system, and it is this that shapes our preferences."

Section D: Schwartz's study also casts light on the long-running question of whether animals understand or appreciate music. Despite the apparent abundance of "music" in the natural world- birdsong, whalesong, wolf howls, synchronized chimpanzee hooting previous studies have found that many laboratory animals don't show a great affinity for the human variety of music making. Marc Hauser and Josh McDermott of Harvard argued in the July issue of Nature Neuroscience that animals don't create or perceive music the way we do. The fact that laboratory monkeys can show recognition of human tunes is evidence, they say, of shared general features of the auditory system, not any specific chimpanzee musical ability. As for birds, those most musical beasts, they generally recognize their own tunes - a narrow repertoire - but don't generate novel melodies like we do. There are no avian Mozarts.

But what's been played to the animals, Schwartz notes, is human music. If animals evolve preferences for sound as we do - based upon the soundscape in which they live - then their "music" would be fundamentally different from ours. In the same way our scales derive from human utterances, a cat's idea of a good tune would derive from yowls and meows. To demonstrate that animals don't appreciate sounds the way we do, we'd need evidence that they don't respond to "music" constructed from their own sound environment.

Section E: No matter how the connection between language and music is parsed, what is apparent is that our sense of music, even our love for it, is as deeply rooted in our biology and in our brains as language is. This is most obvious with babies, says Sandra

Trehub at the University of Toronto, who also published a paper in the Nature Neuroscience special issue.

For babies, music and speech are on a continuum. Mothers use musical speech to "regulate infants' emotional states." Trehub says. Regardless of what language they speak, the voice all mothers use with babies is the same: "something between speech and song." This kind of communication "puts the baby in a trance-like state, which may proceed to sleep or extended periods of rapture." So if the babies of the world could understand the latest research on language and music, they probably wouldn't be very surprised. The upshot, says Trehub, is that music may be even more of a necessity than we realize.

Question 27 - 31

Reading Passage 3 has five sections A-E.

Choose the correct heading for each section from the list of headings below. Write the correct number i-viii in boxes 27-31 on your answer sheet.

List of Headings

- i. Animal sometimes make music.
- ii. Recent research on music
- iii. Culture embedded in music
- iv. Historical theories review
- v. Communication in music with animals
- vi. Contrast between music and language
- vii. Questions on a biological link with human and music
- viii. Music is good for babies.

27. Section A

28. Section B

29. Section C

30. Section D

31. Section E

Questions 32-38

Look at the following people and list of statements below. Match each person with the correct statement.

Write the correct letter A-G in boxes 32-38 on your answer sheet.

List of statements

- A. Music exists outside of the world in which it is created
- B. Music has a common feature though cultural influences affect
- C. Humans need music
- D. Music priority connects to the disordered sound around
- E. Discovery of mathematical musical foundation
- F. Music is not treat equally well compared with language
- G. Humans and monkeys have similar traits in perceiving sound

- 32. Steven Pinker
- 33. Musicologists
- 34. Greek philosopher Pythagoras
- 35. Schwartz, Howe, and Purves
- 36. Marc Hauser and Josh McDermott
- 37. Charles Rosen
- 38. Sandra Trehub

Questions 39-40

Choose the correct letter A, B, C or D

Write your answers in boxes 39-40 on your answer sheet.

39 Why was the study of animal's music uncertain?

- A. Animals don't have the same auditory system as humans.
- B. Experiments on animal's music are limited.
- C. tunes are impossible for animal to make up.
- D. Animals don't have spontaneous ability for the tests.

40. What is the main subject of this passage?

- A. Language and psychology.
- B. Music formation.
- C. Role of music in human society.
- D. Music experiments for animals.

Reading Test 31

SECTION 1

California's age of Megafires

A There's a reason fire squads now battling more than a dozen blazes in southern California are having such difficulty containing the flames, despite better preparedness than ever and decades of experience fighting fires fanned by the notorious Santa Ana winds. The wildfires themselves, experts say, generally are hotter, move faster, and spread more erratically than in the past.

B The short-term explanation is that the region, which usually has dry summers, has had nine inches less rain than normal this year. Longer term, climate change across the West is leading to hotter days on average and longer fire seasons. Experts say this is likely to yield more megafires like the conflagrations that this week forced evacuations of at least 300,000 resident in California's southland and led President Bush to declare a disaster emergency in seven counties on Tuesday.

C Megafires, also called "siege fires," are the increasingly frequent blazes that bum 500,000 acres or more - 10 times the size of the average forest fire of 20 years ago. One of the current wildfires is the sixth biggest in California ever, in terms of acreage burned, according to state figures and news reports. The trend to more superhot fires, experts say, has been driven by a century-long policy of the US Forest Service to stop wildfires as quickly as possible. The unintentional consequence was to halt the natural eradication of underbrush, now the primary fuel for megafires. Three other factors contribute to the trend, they add. First is climate change marked by a 1 -degree F. rise in average yearly temperature across the West. Second is a fire season that on average is 78 days longer than in the late 1980s. Third is increased building of homes and other structures in wooded areas.

D "We are increasingly building our homes ... in fire-prone ecosystems," says Dominik Kulakowski, adjunct professor of biology at Clark University Graduate School of

Geography in Worcester, Mass. Doing that "in many of the forests of the Western US ... is like building homes on the side of an active volcano." In California, where population growth has averaged more than 600,000 a year for at least a decade, housing has pushed into such areas. "What once was open space is now residential homes providing fuel to make fires burn with greater intensity," says Terry McHale of the California Department of Forestry firefighters union. "With so much dryness, so many communities to catch fire, so many fronts to fight, it becomes an almost incredible job."

E That said, many experts give California high marks for making progress on preparedness since 2003, when the largest fires in state history scorched 750,000 acres, burned 3,640 homes, and killed 22 people. Stung then by criticism of bungling that allowed fires to spread when they might have been contained, personnel are meeting the peculiar challenges of neighborhood- and canyon-hopping fires better than in recent years, observers say.

F State promises to provide newer engines, planes, and helicopters have been fulfilled. Firefighters unions that then complained of dilapidated equipment, old fire engines, and insufficient blueprints for fire safety are now praising the state's commitment, noting that funding for firefighting has increased despite huge cuts in many other programs. "We are pleased that the Schwarzenegger administration has been very proactive in its support of us and come through with budgetary support of the infrastructure needs we have long sought," says Mr. McHale with the firefighters union.

G Besides providing money to upgrade the fire engines that must traverse the mammoth state and wind along serpentine canyon roads, the state has invested in better command- and-control facilities as well as the strategies to run them. "In the fire sieges of earlier years, we found out that we had the willingness of mutual-aid help from other jurisdictions and states, but we were not able to communicate adequately with them," says Kim Zagaris, chief of the state's Office of Emergency Services, fire and rescue branch. After a 2004 blue-ribbon commission examined and revamped those procedures, the statewide response "has become far more professional and responsive," he says.

H Besides ordering the California National Guard on Monday to make 1,500 guardsmen available for firefighting efforts, Gov. Arnold Schwarzenegger asked the Pentagon to send all available Modular Airborne Fighting Systems to the area. The military Lockheed C- 130 cargo/utility aircraft carry a pressurized 3,000-gallon tank that can eject fire retardant or water in fewer than five seconds through two tubes at the rear of the plane. This load can cover an area 1/4- mile long and 60 feet wide to create a fire barrier. Governor Schwarzenegger also directed 2,300 inmate firefighters and 170 custody staff from the California Department of Corrections and Rehabilitation to work hand in hand with state and local firefighters.

I Residents and government officials alike are noting the improvements with gratitude, even amid the loss of homes, churches, businesses, and farms. By Tuesday morning, the fires had burned 1,200 homes and businesses and set 245,957 acres — 384 square miles

— ablaze. Despite such losses, there is a sense that the speed, dedication, and coordination of firefighters from several states and jurisdictions are resulting in greater efficiency than in past "siege fire" situations.

J "I am extraordinarily impressed by the improvements we have witnessed between the last big fire and this," says Ross Simmons, a San Diego-based lawyer who had to evacuate both his home and business on Monday, taking up residence at a Hampton Inn 30 miles south of his home in Rancho Bernardo. After fires consumed 172,000 acres there in 2003, the San Diego region turned communitywide soul-searching into improved building codes, evacuation procedures, and procurement of new technology. Mr. Simmons and neighbors began receiving automated phone calls at 3:30 a.m. Monday morning telling them to evacuate. "Notwithstanding all the damage that will be caused by this, we will not come close to the loss of life because of what we have ... put in place since then," he says.

Questions 1-6

Complete the following summary of the paragraphs of Reading Passage, using no

more than two words from the Reading Passage for each answer. Write your answers in boxes 1-6 on your answer sheet.

Experts point out that blazes in California are having more heat, faster speed and they _____1_____ more unpredictably compared with former ones. One explanation is that California's summer is dry, _____2_____ is below the average point. Another long term explanation is that hotter and longer potential days occur due to _____3_____. Nowadays, Megafires burn _____4_____ the size of forest area caused by an ordinary fire of 20 years ago. The serious trend is mainly caused by well-grown underbrush, which provides _____5_____ for the siege fires. Other contributors are climate change and extended _____6_____.

Questions 7-9

Choose the correct letter, **A**, **B**, **C** or **D**.

Write your answers in boxes 7-9 on your answer sheet.

7. What is expert's attitude towards California's performance after 2003 megafire?

- A. They could have done better
- B. Blamed them on casualties
- C. Improvement made on preparation
- D. Serious criticism

8. According to Governor Schwarzenegger, which one is CORRECT about his effort for firefighting?

- A. Schwarzenegger requested successfully for military weapons
- B. Schwarzenegger led many prison management staff to work together with local fire fighters
- C. Schwarzenegger acted negatively in recent megafire in California
- D. Schwarzenegger ordered 1,500 office clerks to join firefighting scene.

9. What happened to Ross Simmon on the day of megafire break out?

- A. He was sleeping till morning
- B. He was doing business at Hampton Inn

- C. He suffered employee death on that morning
- D. He was alarmed by machine calls

Questions 10-13

Do the following statements agree with the information given in Reading Passage 1?

In boxes 10-13 on your answer sheet, write

TRUE	if the statement is true
FALSE	if the statement is false
NOT GIVEN	if the information is not given in the passage

- 10. The area of open space in California has declined during the past decade.
- 11. Fire squad wants to recruit more firefighters this year.
- 12. Firefighters union declared that firefighters have had more improved and supportive facility by the local government.
- 13. Before the year of 2004, well coordination and communication between California and other states already existed in fire siege.

SECTION 2

European Heat Wave

A It was the summer, scientists now realise, when felt. We knew that summer 2003 was remarkable: global warming at last made itself unmistakably Britain experienced its record high temperature and continental Europe saw forest fires raging out of control, great rivers drying of a trickle and thousands of heat-related deaths. But just how remarkable is only now becoming clear

B The three months of June, July and August were the warmest ever recorded in western and central Europe, with record national highs in Portugal, Germany and Switzerland as well as Britain. And they were the warmest by a very long way Over a great rectangular block of the earth stretching from west of Paris to northern Italy, taking in Switzerland and southern Germany, the average temperature for the summer months was 3.78°C above the long-term norm, said the Climatic Research Unit (CRU) of the University of East Anglia in Norwich, which is one of the world's leading institutions for the monitoring and analysis of temperature records.

C That excess might not seem a lot until you are aware of the context - but then you realise it is enormous. There is nothing like this in previous data, anywhere. It is considered so exceptional that Professor Phil Jones, the CRU's director, is prepared to say openly - in a way few scientists have done before - that the 2003 extreme may be directly attributed, not to natural climate variability, but to global warming caused by human actions.

D Meteorologists have hitherto contented themselves with the formula that recent high temperatures are consistent with predictions" of climate change. For the great block of the map — that stretching between 3 5-5 ON and 0-20E - the CRU has reliable temperature records dating back to 1781. Using as a baseline the average summer temperature recorded between 1961 and 1990, departures from the temperature norm, or "anomalies": over the area as a whole can easily be plotted. As the graph shows,

such is the variability of our climate that over the past 200 years, there have been at least half a dozen anomalies, in terms of excess temperature - the peaks on the graph denoting very hot years - approaching, or even exceeding, 20 °C. But there has been nothing remotely like 2003, when the anomaly is nearly four degrees.

E "This is quite remarkable," Professor Jones told The Independent. "It's very unusual in a statistical sense. If this series had a normal statistical distribution, you wouldn't get this number. There turn period "how often it could be expected to recur" would be something like one in a thousand years. If we look at an excess above the average of nearly four degrees, then perhaps nearly three degrees of that is natural variability, because we've seen that in past summers. But the final degree of it is likely to be due to global warming, caused by human actions.

F The summer of 2003 has, in a sense, been one that climate scientists have long been expecting. Until now, the warming has been manifesting itself mainly in winters that have been less cold than in summers that have been much hotter. Last week, the United Nations predicted that winters were warming so quickly that winter sports would die out in Europe's lower-level ski resorts. But sooner or later the unprecedented hot summer was bound to come, and this year it did.

G One of the most dramatic features of the summer was the hot nights, especially in the first half of August. In Paris, the temperature never dropped below 23.0°C (73.40°F) at all between 7 and 14 August, and the city recorded its warmest-ever night on 11-12 August, when the mercury did not drop below 25.50°C (77.90°F). Germany recorded its warmest- ever night at Weinbiet in the Rhine valley with a lowest figure of 27.60°C (80.60°F) on 13 August, and similar record-breaking night-time temperatures were recorded in Switzerland and Italy.

H The 15,000 excess deaths in France during August, compared with previous years, have been related to the high night-time temperatures. The number gradually increased during the first 12 days of the month, peaking at about 2,000 per day on the night of 12-13 August, then fell off dramatically after 14 August when the minimum temperatures fell by about 50C. The elderly were most affected, with a 70 per cent increase in

mortality rate in those aged 75-94.

I For Britain, the year as a whole is likely to be the warmest ever recorded, but despite the high temperature record on 10 August, the summer itself - defined as the June, July and August period - still comes behind 1976 and 1995, when there were longer periods of intense heat. At the moment, the year is on course to be the third-hottest ever in the global temperature record, which goes back to 1856, behind 1998 and 2002 but when all the records for October, November and December are collated, it might move into second place, Professor Jones said. The 10 hottest years in the record have all now occurred since 1990. Professor Jones is in no doubt about the astonishing nature of European summer of 2003. "The temperatures recorded were out of all proportion to the previous record," he said. "It was the warmest summer in the past 500 years and probably way beyond that It was enormously exceptional."

J His colleagues at the University of East Anglia's Tyndall Centre for Climate Change Research are now planning a special study of it. "It was a summer that has not: been experienced before, either in terms of the temperature extremes that were reached, or the range and diversity of the impacts of the extreme heat," said the centre's executive director, Professor Mike Hulme. "It will certainly have left its mark on a number of countries, as to how they think and plan for climate change in the future, much as the 2000 floods have revolutionised the way the Government is thinking about flooding in the UK. "The 2003 heat wave will have similar repercussions across Europe."

Questions 14-19

Do the following statements agree with the information given in Reading Passage 2? In boxes 14-19 on your answer sheet, write

TRUE if the statement is true

FALSE if the statement is false

NOT GIVEN if the information is not given in the passage

14. The average summer temperature in 2003 is approximately four degrees higher than that of the past.

15. Jones believes the temperature statistic is within the normal range.

16. Human factor is one of the reasons that caused hot summer.

17. In large city, people usually measure temperature twice a day.
18. Global warming has obvious effect of warmer winter instead of hotter summer before 2003.
19. New ski resorts are to be built on a high-altitude spot.

Questions 20-21

Answer the questions below using NO MORE THAN THREE WORDS AND/OR NUMBERS from the passage for each answer. Write your answers in boxes 20-21 on your answer sheet

20. What are the two hottest years in Britain besides 2003?
21. What will affect UK government policies besides climate change according to Hulme?

Questions 22-26

Complete the summary below using NO MORE THAN THREE WORDS AND/OR NUMBERS from the passage. Write your answers in boxes 22-26 On your answer sheet

In the summer of 2003, thousands of extra death occurred in the country of _____²²_____. Moreover, world-widely, the third record of hottest summer date from _____²³_____, after the year of _____²⁴_____. According to Jones, all the 10 hottest years happened from _____²⁵_____. However, summer of 2003 was at the peak of previous _____²⁶_____ years, perhaps even more.

Question 27

Choose the correct letter A, B, C or D

Write your answer in box 27 on your answer sheet

27. Which one can be best served as the title of this passage in the following options?

- A. Global Warming effect
- B. Global Warming in Europe
- C. The Effects of hot temperature
- D. Hottest summer in Europe

SECTION 3

The concept of childhood in the western countries

The history of childhood has been a topic of interest in social history since the highly influential 1960 book *Centuries of Childhood*, written by French historian Philippe Aries. He argued that "childhood" is a concept created by modern society.

A One of the most hotly debated issues in the history of childhood has been whether childhood is itself a recent invention. The historian Philippe Aries argued that in Western Europe during the Middle Ages (up to about the end of the fifteenth century) children were regarded as miniature adults, with all the intellect and personality that this implies. He scrutinized medieval pictures and diaries, and found no distinction between children and adults as they shared similar leisure activities and often the same type of work. Aries, however, pointed out that this is not to suggest that children were neglected, forsaken or despised. The idea of childhood is not to be confused with affection for children; it corresponds to an awareness of the particular nature of childhood, that particular nature which distinguishes the child from the adult, even the young adult.

B There is a long tradition of the children of the poor playing a functional role in contributing to the family income by working either inside or outside the home. In this sense children are seen as 'useful. Back in the Middle Ages, children as young as 5 or 6 did important chores for their parents and, from the sixteenth century, were often encouraged (or forced) to leave the family by the age of 9 or 10 to work as servants for wealthier families or to be apprenticed to a trade.

C With industrialization in the eighteenth and nineteenth centuries, a new demand for child labour was created, and many children were forced to work for long hours, in mines, workshops and factories. Social reformers began to question whether labouring long hours from an early age would harm children's growing bodies. They began to recognize the potential of carrying out systematic studies to monitor how far these early deprivations might be affecting children's development.

D Gradually, the concerns of the reformers began to impact on the working conditions of children. In Britain, the Factory Act of 1833 signified the beginning of legal protection of children from exploitation and was linked to the rise of schools for factory children. The worst forms of child exploitation were gradually eliminated, partly through factory reform but also through the influence of trade unions and economic changes during the nineteenth century which made some forms of child labour redundant. Childhood was increasingly seen as a time for play and education for all children, not just for a privileged minority. Initiating children into work as 'useful' children became less of a priority. As the age for starting full-time work was delayed, so childhood was increasingly understood as a more extended phase of dependency, development and learning. Even so, work continued to play a significant, if less central role in children's lives throughout the later nineteenth and twentieth century. And the 'useful child, has become a controversial image during the first decade of the twenty-first century especially in the context of global concern about large numbers of the world's children engaged in child labour .

E The Factory Act of 1833 established half-time schools which allowed children to work and attend school. But in the 1840s, a large proportion of children never went to school, and if they did, they left by the age of 10 or 11. The situation was very different by the end of the nineteenth century in Britain. The school became central to images of a normal childhood .

F Attending school was no longer a privilege and all children were expected to spend a significant part of their day in a classroom. By going to school, children's lives were now separated from domestic life at home and from the adult world of work. School became an institution dedicated to shaping the minds, behaviour and morals of the young. Education dominated the management of children's waking hours, not just through the hours spent in classrooms but through 'home' work, the growth of after school activities and the importance attached to 'parental involvement.

G Industrialization, urbanization and mass schooling also set new challenges for those responsible for protecting children's welfare, and promoting their learning. Increasingly,

children were being treated as a group with distinctive needs and they were organized into groups according to their age. For example, teachers needed to know what to expect of children in their classrooms, what kinds of instruction were appropriate for different age groups and how best to assess children's progress. They also wanted tools that could enable them to sort and select children according to their abilities and potential.

Questions 28-34

Do the following statements agree with the information given in Reading Passage 3? Write your answers in boxes 28-34 on your answer sheet.

TRUE	if the statement is true
FALSE	if the statement is false
NOT GIVEN	if the information is not given in the passage

28. Aries pointed out that children did different types of work as adults during the Middle Age.
29. During the Middle Age, going to work necessarily means children were unloved indicated by Aries.
30. Scientists think that overworked labour damages the health of young children
31. the rise of trade union majorly contributed to the protection children from exploitation in 19th century
32. By the aid of half-time schools, most children went to school in the mid of 19 century.
33. In 20 century almost all children need to go to school in full time schedule.
34. Nowadays, children's needs were much differentiated and categorised based on how old they are

Questions 35-40

Answer the questions below.

Choose NO MORE THAN THREE WORDS from the passage for each answer. Write your answers in boxes 35-40 on your answer sheet.

35. what is the controversial topic arises with the French historian Philippe Aries's concept

36. what image for children did Aries believed to be like in Western Europe during the Middle Ages
37. what historical event generated the need for great amount child labour to work long time in 18 and 19 century
38. what legal format initiated the protection of children from exploitation in 19th centenary
39. what the activities were more and more regarded as being preferable for almost all children time in 19th centenary
40. where has been the central area for children to spend largely of their day as people's expectation in modern society

Reading Test 32

SECTION 1

You should spend about 20 minutes on Questions 1-13, which are based on Reading Passage 1 on the following pages

Natural Pesticide in India

A A dramatic story about cotton farmers in India shows how destructive pesticides can be for people and the environment; and why today's agriculture is so dependent on pesticides. This story also shows that it's possible to stop using chemical pesticides without losing a crop to ravaging insects, and it explains how to do it.

B The story began about 30 years ago, a handful of families migrated from the Guntur district of Andhra Pradesh, southeast India, into Punukula, a community of around 900 people farming plots of between two and 10 acres. The outsiders from Guntur brought cotton-culture with them. Cotton wooed farmers by promising to bring in more hard cash than the mixed crops they were already growing to eat and sell: millet, sorghum, groundnuts, pigeon peas, mung beans, chilli and rice. But raising cotton meant using pesticides and fertilisers - until then a mystery to the mostly illiterate farmers of the community. When cotton production started spreading through Andhra Pradesh state. The high value of cotton made it an exceptionally attractive crop, but growing cotton required chemical fertilizers and pesticides. As most of the farmers were poor, illiterate, and without previous experience using agricultural chemicals, they were forced to rely on local, small-scale agricultural dealers for advice. The dealers sold them seeds, fertilizers, and pesticides on credit and also guaranteed purchase of their crop. The dealers themselves had little technical knowledge about pesticides. They merely passed on promotional information from multinational chemical companies that supplied their products. At first, cotton yields were high, and expenses for pesticides were low because cotton pests had not yet moved in. The farmers had never earned so much! But within a few years, cotton pests like bollworms and aphids plagued the fields, and the farmers saw how rapid insect evolution can be. Repeated spraying killed

off the weaker pests, but left the ones most resistant to pesticides to multiply. As pesticide resistance mounted, the farmers had to apply more and more of the pesticides to get the same results. At the same time, the pesticides killed off birds, wasps, beetles, spiders, and other predators that had once provided natural control of pest insects. Without these predators, the pests could destroy the entire crop if pesticides were not used. Eventually, farmers were mixing pesticide "cocktails" containing as many as ten different brands and sometimes having to spray their cotton as frequently as two times a week. They were really hooked!

D The villagers were hesitant, but one of Punukula's village elders decided to risk trying the natural methods instead of pesticides. His son had collapsed with acute pesticide poisoning and survived but the hospital bill was staggering. SECURE's staff coached this villager on how to protect his cotton crop by using a toolkit of natural methods that India's Center for Sustainable Agriculture put together in collaboration with scientists at Andhra Pradesh's state university. They called the toolkit "Non-Pesticide Management" — or "NPM."

E The most important resource in the NPM toolkit was the neem tree (*Azadirachta indica*) which is common throughout much of India. Neem tree is a broad-leaved evergreen tree related to mahogany. It protects itself against insects by producing a multitude of natural pesticides that work in a variety of ways: with an arsenal of chemical defenses that repel egg-laying, interfere with insect growth, and most important, disrupt the ability of crop-eating insects to sense their food.

F In fact, neem has been used traditionally in India to protect stored grains from insects and to produce soaps, skin lotions, and other health products. To protect crops from insects, neem seeds are simply ground into a powder that is soaked overnight in water. The solution is then sprayed onto the crop. Another preparation, neem cake, can be mixed into the soil to kill pests and diseases in the soil, and it doubles as an organic fertilizer high in nitrogen. Neem trees grow locally, so the only "cost" is the labor to prepare neem for application to fields.

G The first farmer's trial with NPM was a complete success! His harvest was as good

as the harvests of farmers that were using pesticides, and he earned much more because he did not spend a single rupee on pesticides. Inspired by this success, 20 farmers tried NPM the next year. SECURE posted two well-trained staff in Punukula to teach and help everyone in the village, and the village women put pressure on their husbands to stop using toxic chemicals. Families that were no longer exposing themselves to pesticides began to feel much better, and the rapid improvements in income, health, and general wellbeing quickly sold everyone on the value of NPM. By 2000, all the farmers in Punukula were using NPM, not only for cotton, but for their other crops as well.

H The suicide epidemic came to an end. And with the cash, health, and energy that returned when they stopped poisoning themselves with pesticides, the villagers were inspired to start more community and business projects. The women of Punukula created a new source of income by collecting, grinding, and selling neem seeds for NPM in other villages. The villagers rescued their indentured children and gave them special six-month "catch-up" courses to return to school.

I Fighting against pesticides, and winning, increased village solidarity, self-confidence, and optimism about the future. When dealers tried to punish NPM users by paying less for NPM cotton, the farmers united to form a marketing cooperative that found fairer prices elsewhere. The leadership and collaboration skills that the citizens of Punukula developed in the NPM struggle have helped them to take on other challenges, like water purification, building a cotton gin to add value to the cotton before they sell it, and convincing the state government to support NPM over the objection of multi-national pesticide corporations.

Questions 1-4

Do the following statements agree with the information given in Reading Passage 1?

In boxes 1-4 on your answer sheet, write

TRUE *if the statement is true*

FALSE *if the statement is false*

NOT GIVEN *if the information is not given in the passage*

1. Cotton in Andhra Pradesh state could really bring more income to the local farmers than traditional farming.
2. The majority of farmers had used the agricultural pesticides before 30 years ago.
3. The yield of cotton is relatively lower than that of other agricultural crops.
4. The farmers didn't realize the spread of the pests was so fast.

Questions 5-11

Complete the summary below.

Choose **NO MORE THAN TWO WORDS** from the passage for each answer, Write your answers in boxes 5-10 on your answer sheet.

The Making of pesticide protecting crops against insects

The broad-leaved neem tree was chosen, it is a fast-growing and 5 _____ tree and produces amount of 6 _____ for itself that can be effective like insects repellent. Firstly, neem seeds need to be crushed into 7 _____ form, which is left behind 8 _____ in water. Then we need to spray the solution onto the crop. A special 9 _____ is used when mix with soil in order to eliminate bugs and bacteria, and its effect 10 _____ when it adds the level of 11 _____ in this organic fertilizer meanwhile.

Questions 12-14

Answer the questions below. choose **NO MORE THAN TWO WORDS AND/OR A NUMBER** from the passage for each answer Write your answers in boxes 12-14 on your answer sheet.

12. In which year did all the farmers use NPM for their crops in Punukula?
13. What gave the women of Punukula a business opportunity to NPMs?
14. Name one project that the citizens of Punukula decide to develop in the NPM.

SECTION 2

You should spend about 20 minutes on Questions 15 - 27, which are based on Reading Passage 2 below.

Numeracy: Can animals tell numbers?

A

Prime among basic numerical faculties is the ability to distinguish between a larger and a smaller number, says psychologist Elizabeth Brannon. Humans can do this with ease - providing the ratio is big enough - but do other animals share this ability? In one experiment, rhesus monkeys and university students examined two sets of geometrical objects that appeared briefly on a computer monitor. They had to decide which set contained more objects. Both groups performed successfully but, importantly, Brannon's team found that monkeys, like humans, make more errors when two sets of objects are close in number. The students' performance ends up looking just like a monkey's. It's practically identical, 'she says.

B

Humans and monkeys are mammals, in the animal family known as primates. These are not the only animals whose numerical capacities rely on ratio, however. The same seems to apply to some amphibians. Psychologist Claudia Uller's team tempted salamanders with two sets of fruit flies held in clear tubes. In a series of trials, the researchers noted which tube the salamanders scampered towards, reasoning that if they had a capacity to recognise number, they would head for the larger number. The salamanders successfully discriminated between tubes containing 8 and 16 flies respectively, but not between 3 and 4, 4 and 6, or 8 and 12. So it seems that for the salamanders to discriminate between two numbers, the larger must be at least twice as big as the smaller. However, they could differentiate between 2 and 3 flies just as well as between 1 and 2 flies, suggesting they recognise small numbers in a different way from larger numbers.

C

Further support for this theory comes from studies of mosquitofish, which instinctively join the biggest shoal they can. A team at the University of Padova found that while

mosquitofish can tell the difference between a group containing 3 shoal-mates and a group containing 4, they did not show a preference between groups of 4 and 5. The team also found that mosquitofish can discriminate between numbers up to 16, but only if the ratio between the fish in each shoal was greater than 2:1. This indicates that the fish, like salamanders, possess both the approximate and precise number systems found in more intelligent animals such as infant humans and other primates.

D

While these findings are highly suggestive, some critics argue that the animals might be relying on other factors to complete the tasks, without considering the number itself. 'Any study that's claiming an animal is capable of representing number should also be controlling for other factors,' says Brannon. Experiments have confirmed that primates can indeed perform numerical feats without extra clues, but what about the more primitive animals?

E

To consider this possibility, the mosquito fish tests were repeated, this time using varying geometrical shapes in place of fish. The team arranged these shapes so that they had the same overall surface area and luminance even though they contained a different number of objects. Across hundreds of trials on 14 different fish, the team found they consistently discriminated 2 objects from 3. The team is now testing whether mosquitofish can also distinguish 3 geometric objects from 4.

F

Even more primitive organisms may share this ability. Entomologist Jurgen Tautz sent a group of bees down a corridor, at the end of which lay two chambers - one which contained sugar water, which they like, while the other was empty. To test the bees' numeracy, the team marked each chamber with a different number of geometrical shapes

- between 2 and 6. The bees quickly learned to match the number of shapes with the correct chamber. Like the salamanders and fish, there was a limit to the bees' mathematical prowess - they could differentiate up to 4 hapes, but failed with 5 or 6 shapes.

G

These studies still do not show whether animals learn to count through training, or whether they are born with the skills already intact. If the latter is true, it would suggest there was a strong evolutionary advantage to a mathematical mind. Proof that this may be the case has emerged from an experiment testing the mathematical ability of three- and four-day-old chicks. Like mosquitofish, chicks prefer to be around as many of their siblings as possible, so they will always head towards a larger number of their kin. If chicks spend their first few days surrounded by certain objects, they become attached to these objects as if they were family. Researchers placed each chick in the middle of a platform and showed it two groups of balls of paper. Next, they hid the two piles behind screens, changed the quantities and revealed them to the chick. This forced the chick to perform simple computations to decide which side now contained the biggest number of its "brothers". Without any prior coaching, the chicks scuttled to the larger quantity at a rate well above chance. They were doing some very simple arithmetic, claim the researchers.

H

Why these skills evolved is not hard to imagine, since it would help almost any animal forage for food. Animals on the prowl for sustenance must constantly decide which tree has the most fruit, or which patch of flowers will contain the most nectar. There are also other, less obvious, advantages of numeracy. In one compelling example, researchers in America found that female coots) appear to calculate how many eggs they have laid – and add any in the nest laid by an intruder - before making any decisions about adding to them. Exactly how ancient these skills are is difficult to determine, however. Only by studying the numerical abilities of more and more creatures using standardized procedures can we hope to understand the basic preconditions for the evolution of number.

Questions 15-21

Answer the table below.

Choose NO MORE THAN THREE WORDS AND/OR A NUMBER from the passage for each answer. Write your answers in boxes 15-21 on your answer sheet

Animal Numeracy		
Subjects	Experiments	Results
Mammals and birds		
rhesus monkeys and humans	looked at two sets of geometrical objects on computer screen	performance of two groups is almost 15.....
Chicks	chose between two sets of 16..... which are altered	chicks can do calculations in order to choose larger group
Coots	behaviour of female birds was observed	bird seems to have ability to 17.....
Amphibians, fish and insects		

Salamanders	offered clear tubes containing different quantities of 18.....	salamanders distinguish between numbers over four if bigger number is at least two times larger
19	shown real shoals and later artificial ones of geometrical shapes; these are used to check influence of total 20..... an d brightness	subjects know difference between two and three and possibly three and four, but not between four and five

Bees	had to learn where 21..... was stored	could soon choose correct place
------	--	------------------------------------

Question 22-27

Do the following statements agree with the information given in Reading Passage 2?
In boxes 22-27 on your answer sheet, write

TRUE if the statement is true
FALSE if the statement is false
NOT GIVEN if the information is not given in the passage

- 22. Primates are better at identifying the larger of two numbers if one is much bigger than the other.
- 23. Jurgen Tautz trained the insects in his experiment to recognise the shapes of individual numbers.
- 24. The research involving young chicks took place over two separate days.
- 25. The experiment with chicks suggests that some numerical ability exists in newborn animals.
- 26. Researchers have experimented by altering quantities of nectar or fruit available to certain wild animals.
- 27. When assessing the number of eggs in their nest, coots take into account those of other birds.

SECTION 3

Multitasking Debate

Can you do them at the same time?

A

Talking on the phone while driving isn't the only situation where we're worse at multitasking than we might like to think we are. New studies have identified a bottleneck in our brains that some say means we are fundamentally incapable of true multitasking. If experimental findings reflect real-world performance, people who think they are multitasking are probably just underperforming in all - or at best, all but one - of their parallel pursuits. Practice might improve your performance, but you will never be as good as when focusing on one task at a time.

B

The problem, according to Rene Marois, a psychologist at Vanderbilt University in Nashville, Tennessee, is that there's a sticking point in the brain. To demonstrate this, Marois devised an experiment to locate it. Volunteers watch a screen and when a particular image appears, a red circle, say, they have to press a key with their index finger. Different coloured circles require presses from different fingers. Typical response time is about half a second, and the volunteers quickly reach their peak performance. Then they learn to listen to different recordings and respond by making a specific sound. For instance, when they hear a bird chirp, they have to say "ba"; an electronic sound should elicit a "ko", and so on. Again, no problem. A normal person can do that in about half a second, with almost no effort.

C

The trouble comes when Marois shows the volunteers an image, and then almost immediately plays them a sound. Now they're flummoxed. "If you show an image and play a sound at the same time, one task is postponed," he says. In fact, if the second task is introduced within the half-second or so it takes to process and react to the first,

it will simply be delayed until the first one is done. The largest dual-task delays occur when the two tasks are presented simultaneously; delays progressively shorten as the interval between presenting the tasks lengthens.

D

There are at least three points where we seem to get stuck, says Marois. The first is in simply identifying what I we're looking at. This can take a few tenths of a second, during which time we are not able to see and recognise second item. This limitation is known as the "attentional blink": experiments have shown that if you're watching out for a particular event and a second one shows up unexpectedly any time within this crucial window of concentration, it may register in your visual cortex but you will be unable to act upon it. Interestingly, if you don't expect the first event, you have no trouble responding to the second. What exactly causes the attentional blink is still a matter for debate.

E

A second limitation is in our short-term visual memory. It's estimated that we can keep track of about four items at a time, fewer if they are complex. This capacity shortage is thought to explain, in part, our astonishing inability to detect even huge changes in scenes that are otherwise identical, so-called "change blindness". Show people pairs of near- identical photos - say, aircraft engines in one picture have disappeared in the other - and they will fail to spot the differences. Here again, though, there is disagreement about what the essential limiting factor really is. Does it come down to a dearth of storage capacity, or is it about how much attention a viewer is paying?

F

A third limitation is that choosing a response to a stimulus - braking when you see a child in the road, for instance, or replying when your mother tells you over the phone that she' s thinking of leaving your dad - also takes brainpower. Selecting a response to one of these things will delay by some tenths of a second your ability to respond to the other. This is called the "response selection bottleneck" theory, first proposed in 1952.

G

But David Meyer, a psychologist at the University of Michigan, Ann Arbor, doesn't buy the bottleneck idea. He thinks dual-task interference is just evidence of a strategy used by the brain to prioritise multiple activities. Meyer is known as something of an optimist by his peers. He has written papers with titles like "Virtually perfect time-sharing in dual-task performance: Uncorking the central cognitive bottleneck". His experiments have shown that with enough practice - at least 2000 tries - some people can execute two tasks simultaneously as competently as if they were doing them one after the other. He suggests that there is a central cognitive processor that coordinates all this and, what's more, he thinks it uses discretion sometimes it chooses to delay one task while completing another.

H

Marois agrees that practice can sometimes erase interference effects. He has found that with just 1 hour of practice each day for two weeks, volunteers show a huge improvement at managing both his tasks at once. Where he disagrees with Meyer is in what the brain is doing to achieve this. Marois speculates that practice might give us the chance to find less congested circuits to execute a task - rather like finding trusty back streets to avoid heavy traffic on main roads - effectively making our response to the task subconscious. After all, there are plenty of examples of subconscious multitasking that most of us routinely manage: walking and talking, eating and reading, watching TV and folding the laundry.

I

It probably comes as no surprise that, generally speaking, we get worse at multitasking

as we age. According to Art Kramer at the University of Illinois at Urbana- Champaign, who studies how ageing affects our cognitive abilities, we peak in our 20s. Though the decline is slow through our 30s and on into our 50s, it is there; and after 55, it becomes more precipitous. In one study, he and his colleagues had both young and old participants do a simulated driving task while carrying on a conversation. He found that while young drivers tended to miss background changes, older drivers failed to notice things that were highly relevant. Likewise, older subjects had more trouble paying attention to the more important parts of a scene than young drivers.

J

It's not all bad news for over-55s, though. Kramer also found that older people can benefit from practice. Not only did they learn to perform better, brain scans showed that underlying that improvement was a change in the way their brains become active. While it's clear that practice can often make a difference, especially as we age, the basic facts remain sobering. "We have this impression of an almighty complex brain," says Marois, "and yet we have very humbling and crippling limits." For most of our history, we probably never needed to do more than one thing at a time, he says, and so we haven't evolved to be able to. Perhaps we will in future, though. We might yet look back one day on people like Debbie and Alun as ancestors of a new breed of true multitasker.

Questions 28-32

The reading Passage has ten paragraphs A-J. Which paragraph contains the following information?

Write the correct letter in boxes 28-32 on your answer sheet.

- 28. A theory explained delay happens when selecting one reaction
- 29. Different age group responds to important things differently
- 30. Conflicts happened when visual and audio element emerge simultaneously
- 31. An experiment designed to demonstrate the critical part in brain for multitasking
- 32. An viewpoint favors optimistic side of multitask performance

Questions 33-35

Choose the correct letter, A, B, C or D.

Write your answers in boxes 33-35 on your answer sheet.

33 Which one is correct about experiment conducted by Ren6 Marois?

- A. participants performed poorly on listening task solely
- B. volunteers press different key on different color
- C. participants need use different fingers on different colored object
- D. they did a better job on Mixed image and sound information

34 Which statement is correct about the first limitation of Marois's experiment?

- A. "attentional blink" takes about ten seconds
- B. lag occurs if we concentrate on one object while second one appears
- C. we always have trouble in reacting the second one
- D. first limitation can be avoid by certain measures

35 Which one is NOT correct about Meyer's experiments and statements?

- A. just after failure in several attempts can people execute dual-task
- B. Practice can overcome dual-task interference
- C. Meyer holds a different opinion on Marois's theory
- D. an existing processor decides whether delay another task or not

Questions 36-40

Do the following statements agree with the information given in Reading Passage 3?

In boxes 36-40 on your answer sheet, write

YES if the statement is true

NO if the statement is false

NOT GIVEN if the information is not given in the passage

36. Longer gap between two presenting tasks means shorter delay toward the second one.

37. Incapable in human memory cause people sometimes miss the differences when presented two similar images.

38. Marois has different opinion on the claim that training removes bottleneck effect.

39. Art Kramer proved there is a correlation between multitasking performance and genders.
40. The author doesn't believe that effect of practice could bring any variation.

Reading Test 33

SECTION 1

Organic farming and chemical fertilisers

A

The world's population continues to climb. And despite the rise of high-tech agriculture, 800 million people don't get enough to eat. Clearly it's time to rethink the food we eat and where it comes from. Feeding 9 billion people will take more than the same old farming practices, especially if we want to do it without felling rainforests and planting every last scrap of prairie. Finding food for all those people will tax predicting farmers'—and researchers'—ingenuity to the limit. Yet already, precious aquifers that provide irrigation water for some of the world's most productive farmlands are drying up or filling with seawater, and arable land in China is eroding to create vast dust storms that redden sunsets as far away as North America. "Agriculture must become the solution to environmental problems in 50 years. If we don't have systems that make the environment better not just hold the fort—then we're in trouble," says Kenneth Cassman, an agronomist at the University of Nebraska at Lincoln. That view was echoed in January by the Curry report, a government panel that surveyed the future of farming and food in Britain.

B

It's easy to say agriculture has to do better, but what should this friendly farming of the future look like? Concerned consumers come up short at this point, facing what appears to be an ever-widening ideological divide. In one corner are the techno-optimists who put their faith in genetically modified crops, improved agrochemicals and computer-enhanced machinery; in the other are advocates of organic farming, who reject artificial chemicals and embrace back-to-nature techniques such as composting. Both sides cite plausible science to back their claims to the moral high ground, and both bring enough passion to the debate for many people to come away thinking we're faced with a stark choice between two mutually incompatible options.

C

Not so. If you take off the ideological blinkers and simply ask how the world can produce the food it needs with the least environmental cost, a new middle way opens. The key is sustainability: whatever we do must not destroy the capital of soil and water we need to keep on producing. Like today's organic farming, the intelligent farming of the future should pay much more attention to the health of its soil and the ecosystem it's part of. But intelligent farming should also make shrewd and locally appropriate use of chemical fertilisers and pesticides. The most crucial ingredient in this new style of agriculture is not chemicals but information about what's happening in each field and how to respond. Yet ironically, this key element may be the most neglected today.

D

Clearly, organic farming has all the warm, fuzzy sentiment on its side. An approach that eschews synthetic chemicals surely runs no risk of poisoning land and water. And its emphasis on building up natural ecosystems seems to be good for everyone. Perhaps these easy assumptions explain why sales of organic food across Europe are increasing by at least 50 per cent per year.

E

Going organic sounds idyllic-but it's naive, too. Organic agriculture has its own suite of environmental costs, which can be worse than those of conventional farming, especially if it were to become the world norm. But more fundamentally, the organic versus-chemical debate focuses on the wrong question. The issue isn't what you put into a farm, but what you get out of it, both in terms of crop yields and pollutants, and what condition the farm is in when you're done.

F

Take chemical fertilisers, which deliver nitrogen, an essential plant nutrient, to crops along with some phosphorus and potassium. It is a mantra of organic farming that these fertilisers are unwholesome, and plant nutrients must come from natural sources. But in fact the main environmental damage done by chemical fertilisers as opposed to any other kind is through greenhouse gases-carbon dioxide from the fossil fuels used in their synthesis and nitrogen oxides released by their degradation. Excess nitrogen from

chemical fertilisers can pollute groundwater, but so can excess nitrogen from organic manures.

G

On the other hand, relying solely on chemical fertilisers to provide soil nutrients without doing other things to build healthy soil is damaging. Organic farmers don't use chemical fertilisers, so they are very good at building soil fertility by working crop residues and manure into the soil, rotating with legumes that fix atmospheric nitrogen, and other techniques.

H

This generates vital soil nutrients and also creates a soil that is richer in organic matter, so it retains nutrients better and is hospitable to the crop's roots and creatures such as earthworms that help maintain soil fertility. Such soil also holds water better and therefore makes more efficient use of both rainfall and irrigation water. And organic matter ties up CO₂ in the soil, helping to offset emissions from burning fossil fuels and reduce global warming.

I

Advocates of organic farming like to point out that fields managed in this way can produce yields just as high as fields juiced up with synthetic fertilisers. For example, Bill Liebhardt, research manager at the Rodale Institute in Kutztown, Pennsylvania recently compiled the results of such comparisons for corn, wheat, soybeans and tomatoes in the US and found that the organic fields averaged between 94 and 100 per cent of the yields of nearby conventional crops.

J

But this optimistic picture tells only half the story. Farmers can't grow such crops every year if they want to maintain or build soil nutrients without synthetic fertilisers. They need to alternate with soil-building crops such as pasture grasses and legumes such as alfalfa. So in the long term, the yield of staple grains such as wheat, rice and corn must go down.

This is the biggest cost of organic farming. Vaclav Smil of the University of Manitoba in

Winnipeg, Canada, estimates that if farmers worldwide gave up the 80 million tonnes of synthetic fertiliser they now use each year, total grain production would fall by at least half. Either farmers would have to double the amount of land they cultivate- at catastrophic cost to natural habitat --or billions of people would starve.

K

That doesn't mean farmers couldn't get by with less fertilizer. Technologically advanced farmers in wealthy countries, for instance, can now monitor their yields hectare by hectare, or even more finely, throughout a huge field. They can then target their fertiliser to the parts of the field where it will do the most good, instead of responding to average conditions. This increases yield and decreases fertiliser use. Eventually, farmers may - incorporate long-term weather forecasts into their planning as well, so that they can cut back on fertiliser use when the weather is likely to make harvests poor anyway, says Ron Olson, an agronomist with Cargill Fertilizer in Tampa, Florida.

L

Organic techniques certainly have their benefits, especially for poor farmers. But strict "organic agriculture", which prohibits certain technologies and allows others, isn't always better for the environment. Take herbicides, for example. These can leach into waterways and poison both wildlife and people. Just last month, researchers led by Tyrone Hayes at the University of California at Berkeley found that even low concentrations of atrazine, the most commonly used weedkiller in the US, can prevent frog tadpoles from developing properly.

Questions 1 - 4

Use the information in the passage to match the people (listed A-D) with opinions or deeds below. Write the appropriate letters A-D in boxes 1-4 on your answer sheet.

- A. Vaclav Smil
- B. Bill Liebhardt
- C. Kenneth Cassman
- D. Ron Olson

1. Use of chemical fertilizer can be optimised by combining weather information.

2. Organic farming yield is nearly equal to traditional ones.
3. Better agricultural setting is a significant key to solve environmental tough nut.
4. Substantial production loss would happen in case all farmers shifted from using synthetic fertiliser.

Questions 5 - 9

Do the following statements agree with the information given in Reading Passage 1 In boxes 5-9 on your answer sheet, write

YES if the statement agrees with the information
 NO if the statement contradicts the information
 NOT GIVEN if there is no information on this

5. Increasing population, draining irrigation, eroding farmland push agricultural industry to extremity.
6. There are only two options for farmers; they use chemical fertiliser or natural approach.
7. Chemical fertilizer currently are more expensive than the natural fertilisers.
8. In order to keep nutrient in the soil, organic farmers need to rotate planting method.
9. "organic agriculture" is the way that environment-damaging technologies are all strictly forbidden.

Questions 10-13

Complete the following summary of the paragraphs of Reading Passage, using no more than two words from the Reading Passage for each answer. Write your answers in boxes 10-13 on your answer sheet.

Several 10..... approaches need to be applied in order that global population

wouldn't go starved. A team called 11..... repeated the viewpoint of a scholar by a survey in British farming. More and more European farmers believe in 12farming these years .The argument of organic against 13 seems in an inaccurate direction.

SECTION 2

You should spend about 20 minutes on Questions 14-26, which are based on Reading Passage 1 on the following pages.

The Pearl

A

Throughout history, pearls have held a unique presence within the wealthy and powerful. For instance, the pearl was the favored gem of the wealthy during the Roman Empire. This gift from the sea had been brought back from the orient by the Roman conquests. Roman women wore pearls to bed so they could be reminded of their wealth immediately upon waking up. Before jewelers learned to cut gems, the pearl was of greater value than the diamond. In the Orient and Persia Empire, pearls were ground into powders to cure anything from heart disease to epilepsy, with possible aphrodisiac uses as well. Pearls were once considered an exclusive privilege for royalty. A law in 1612 drawn up by the Duke of Saxony prohibited the wearing of pearls by nobility, professors, doctors or their wives in an effort to further distinguish royal appearance. American Indians also used freshwater pearls from the Mississippi River as decorations and jewelry.

B

There are essentially three types of pearls: natural, cultured and imitation. A natural pearl (often called an Oriental pearl) forms when an irritant, such as a piece of sand, works its way into a particular species of oyster, mussel, or clam. As a defense mechanism, the mollusk secretes a fluid to coat the irritant. Layer upon layer of this coating is deposited on the irritant until a lustrous pearl is formed.

C

The only difference natural pearls and cultured pearls is that the irritant is a surgically implanted bead or piece of shell called Mother of Pearl. Often, these shells are ground oyster shells that are worth significant amounts of money in their own right as irritant-

catalysts for quality pearls. The resulting core is, therefore, much larger than in a natural pearl. Yet, as long as there are enough layers of nacre (the secreted fluid covering the irritant) to result in a beautiful, gem-quality pearl, the size of the nucleus is of no consequence to beauty or durability.

D

Pearls can come from either salt or freshwater sources. Typically, saltwater pearls tend to be higher quality, although there are several types of freshwater pearls that are considered high in quality as well. Freshwater pearls tend to be very irregular in shape, with a puffed rice appearance the most prevalent. Nevertheless, it is each individual pearls merits that determines value more than the source of the pearl. Saltwater pearl oysters are usually cultivated in protected lagoons or volcanic atolls. However, most freshwater cultured pearls sold today come from China. Cultured pearls are the response of the shell to a tissue implant. A tiny piece of mantle tissue from a donor shell is transplanted into a recipient shell. This graft will form a pearl sac and the tissue will precipitate calcium carbonate into this pocket. There are a number of options for producing cultured pearls: use freshwater or seawater shells, transplant the graft into the mantle or into the gonad, add a spherical bead or do it non-beaded. The majority of saltwater cultured pearls are grown with beads.

E

Regardless of the method used to acquire a pearl, the process usually takes several years. Mussels must reach a mature age, which can take up to 3 years, and then be implanted or naturally receive an irritant. Once the irritant is in place, it can take up to another 3 years for the pearl to reach its full size. Often, the irritant may be rejected, the pearl will be terrifically misshapen, or the oyster may simply die from disease or countless other complications. By the end of a 5 to 10 year cycle, only 50% of the oysters will have survived. And of the pearls produced, only approximately 5% are of substantial quality for top jewelry makers. From the outset, a pearl farmer can figure on spending over \$100 for every oyster that is farmed, of which many will produce nothing

or die.

F

Imitation pearls are a different story altogether. In most cases, a glass bead is dipped into a solution made from fish scales. This coating is thin and may eventually wear off. One can usually tell an imitation by biting on it. Fake pearls glide across your teeth, while the layers of nacre on real pearls feel gritty. The Island of Mallorca (in Spain) is known for its imitation pearl industry. Quality natural pearls are very rare jewels. The actual value of a natural pearl is determined in the same way as it would be for other "precious" gems. The valuation factors include size, shape, and color, quality of surface, orient and luster. In general, cultured pearls are less valuable than natural pearls, whereas imitation pearls almost have no value. One way that jewelers can determine whether a pearl is cultured or natural is to have a gem lab perform an x-ray of the pearl. If the x-ray reveals a nucleus, the pearl is likely a bead-nucleated saltwater pearl. If no nucleus is present, but irregular and small dark inner spots indicating a cavity are visible, combined with concentric rings of organic substance, the pearl is likely a cultured freshwater. Cultured freshwater pearls can often be confused for natural pearls which present as homogeneous pictures which continuously darken toward the surface of the pearl. Natural pearls will often show larger cavities where organic matter has dried out and decomposed. Although imitation pearls look the part, they do not have the same weight or smoothness as real pearls, and their luster will also dim greatly. Among cultured pearls, Akoya pearls from Japan are some of the most lustrous. A good quality necklace of 40 Akoya pearls measuring 7mm in diameter sells for about \$1,500, while a super- high quality strand sells for about \$4,500. Size on the other hand, has to do with the age of the oyster that created the pearl (the more mature oysters produce larger pearls) and the location in which the pearl was cultured. The South Sea waters of Australia tend to produce the larger pearls; probably because the water along the coast line is supplied with rich nutrients from the ocean floor. Also, the type of mussel common to the area seems to possess a predilection for producing comparatively large pearls

G

Historically, the world's best pearls came from the Persian Gulf, especially around what is now Bahrain. The pearls of the Persian Gulf were natural created and collected by breath-hold divers. The secret to the special luster of Gulf pearls probably derived from the unique mixture of sweet and salt water around the island. Unfortunately, the natural pearl industry of the Persian Gulf ended abruptly in the early 1930's with the discovery of large deposits of oil. Those who once dove for pearls sought prosperity in the economic boom ushered in by the oil industry. The water pollution resulting from spilled oil and indiscriminate over-fishing of oysters essentially ruined the once pristine pearl producing waters of the Gulf. Today, pearl diving is practiced only as a hobby. Still, Bahrain remains one of the foremost trading centers for high quality pearls. In fact, cultured pearls are banned from the Bahrain pearl market, in an effort to preserve the location's heritage. Nowadays, the largest stock of natural pearls probably resides in India. Ironically, much of India's stock of natural pearls came originally from Bahrain. Unlike Bahrain, which has essentially lost its pearl resource, traditional pearl fishing is still practiced on a small scale in India.

Questions 14-17

Reading Passage 1 has seven paragraphs, A-G. Which paragraph contains the following information?

Write the correct letter A-G in boxes 1-4 on your answer sheet.

- 14. ancient stories around the pearl and customers
- 15. Difficulties in cultivating process.
- 16. Factors can decide the value of natural pearls.
- 17. Different growth mechanisms that distinguish the cultured pearls from natural ones.

Questions 18 - 23

Complete the summary below

Choose letter from A-K for each answer. Write them in boxes 5-10 on your answer sheet.

In ancient history, pearls have great importance within the rich and rulers, which was

treated as gem for women in 18And pearls were even used as medicine and sex drug for people in 19..... There are essentially three types of pearls: natural, cultured and imitation. Most freshwater cultured pearls sold today come from China while the 20..... is famous for its imitation pearl industry. The country 21..... usually manufactures some of the glitteriest cultured ones while the nation such as 22..... produces the larger sized pearl due to the favorable environment along the coast line. In the past, one country of 23 in Gulf produced the world's best pearls. Nowadays, the maJor remaining suppliers of the natural pearls belongs to India

- A America B Ancient Rome C Australia
- D Bahrain E China F Japan G India
- H Korea I Mexico J Persia K Spain

Questions 24 - 27

Do the following statements agree with the information given in the Reading Passage 1? In boxes 11-14 on your answer sheet, write

TRUE *If the statement is true*
FALSE *if the statement is false*
NOT GIVEN *if the information is not given in the passage*

24. Often cultured pearl's centre is significantly larger than in a natural pearl.
25. Cultivated cultured pearls are generally valued the same much as natural ones.
26. The size of pearls produced in Japan is usually of smaller size than those came from Australia.
27. Akoya pearls from Japan Glows more deeply than the South Sea pearls of Australia

SECTION 3

Scent of success

A

Innovation and entrepreneurship, in the right mix, can bring spectacular results and propel a business ahead of the pack. Across a diverse range of commercial successes, from the Hills Hoist clothes line to the Cochlear ear implant, it is hard to generalize beyond saying the creators tapped into something consumers could not wait to get their hands on. However, most ideas never make it to the market. Some ideas that innovators are spruiking to potential investors include new water-saving shower heads, a keyless locking system, ping-pong balls that keep pollution out of rainwater tanks, making teeth grow from stem cells inserted in the gum, and technology to stop LPG tanks from exploding. Grant Kearney, chief executive of the Innovation Xchange, which connects businesses to innovation networks, says he hears of great business ideas that he knows will never get on the market. "Ideas by themselves are absolutely useless," he says. "An idea only becomes innovation when it is connected to the right resources and capabilities."

B. One of Australia's latest innovation successes stems from a lemon-scented bath-room cleaner called Shower Power, the formula for which was concocted in a factory in Yatala, Queensland. In 1995, Tom Quinn and John Heron bought a struggling cleaning products business, OzKleen, for 250,000. It was selling 100 different kinds of cleaning products, mainly in bulk. The business was in bad shape, the cleaning formulas were ineffective and environmentally harsh, and there were few regular clients. Now Shower Power is claimed to be the top-selling bathroom cleaning product in the country. In the past 12 months, almost four million bottles of OzKleen's Power products have been sold and the company forecasts 2004 sales of 10 million bottles. The company's, sales in 2003 reached \$11 million, with 700k of business being exports. In particular, Shower Power is making big inroads on the British market.

C. OzKleen's turnaround began when Quinn and Heron hired an industrial chemist to revitalize the product line. Market research showed that people were looking for a better cleaner for the bathroom, universally regarded as the hardest room in the home to clean. The company also wanted to make the product formulas more environmentally friendly. One of Tom Quinn's sons, Peter, aged 24 at the time, began working with the chemist on the formulas, looking at the potential for citrus-based cleaning products. He detested all the chlorine-based cleaning products that dominated the market. "We didn't want to use chlorine, simple as that," he says. "It offers bad working conditions and there's no money in it." Peter looked at citrus ingredients, such as orange peel, to replace the petroleum by-products in cleaners. He is credited with finding the Shower Power formula. "The head," he says. The company is the recipe is in a vault somewhere and in my sole owner of the intellectual property.

D

To begin with, Shower Power was sold only in commercial quantities but Tom Quinn decided to sell it in 750ml bottles after the constant "raves" from customers at their retail store at Beenleigh, near Brisbane. Customers were traveling long distances to buy supplies. Others began writing to OzKleen to say how good Shower Power was. "We did a dummy label and went to see Woolworths," Tom Quinn says. The Woolworths buyer took a bottle home and was able to remove a stain from her basin that had been impossible to shift. From that point on, she championed the product and OzKleen had its first supermarket order, for a palette of Shower Power worth \$3000. "We were over the moon," says OzKleen's financial controller, Belinda McDonnell.

E

Shower Power was released in Australian supermarkets in 1997 and became the top-selling product in its category within six months. It was all hands on deck at the factory, labeling and bottling Shower Power to keep up with demand. OzKleen ditched all other products and rebuilt the business around Shower Power. This stage, recalls McDonnell, was very tough. "It was hand-to-mouth, cash flow was very difficult," she says. OzKleen had to pay new-line fees to supermarket chains, which also squeezed margins.

F

OzKleen's next big break came when the daughter of a Coles Myer executive used the product while on holidays in Queensland and convinced her father that Shower Power should be in Coles supermarkets. Despite the product success, Peter Quinn says the company was wary of how long the sales would last and hesitate to spend money on upgrading the manufacturing process. As a result, he remembers long periods of working around the clock to keep up with orders. Small tanks were still being used so batches were small and bottles were labeled and filled manually. The privately owned OzKleen relied on cash-flow to expand. "The equipment could not keep up with demand," Peter Quinn says. Eventually a new bottling machine was bought for \$50,000 in the hope of streamlining production, but he says: "We got ripped off." Since then he has been developing a new automated bottling machine that can control the amount of foam produced in the liquid, so that bottles can be filled more effectively - "I love coming up with new ideas." The machine is being patented.

G

Peter Quinn says OzKleen's approach to research and development is open slather. "If I need it, I get it. It is about doing something simple that no one else is doing. Most of these things are just sitting in front of people ... it's just seeing the opportunities." With a tried and tested product, OzKleen is expanding overseas and developing more Power-brand household products. Tom Quinn, who previously ran a real estate agency, says: "We are competing with the same market all over the world; the (cleaning) products are sold everywhere." Shower Power, known as Bath Power in Britain, was launched four years ago with the help of an export development grant from the Federal Government. "We wanted to do it straight away because we realized we had the same opportunities worldwide." OzKleen is already number three in the British market, and the next stop is France. The Power range includes cleaning products for carpets, kitchens and pre-wash stain removal. The Quinn and Heron families are still involved. OzKleen has been approached with offers to buy the company, but Tom Quinn says he is happy with things as they are. "We're having too much fun."

Questions 28-34

Reading Passage 1 has six paragraphs, A—G. Which paragraph contains the following

information?

Write the correct letter A-G, in boxes 1-7 on your answer sheet.

NB You may use any letter more than once.

- 28. Description of one family member persuading another of selling cleaning products
- 29. An account of the cooperation of all factory staff to cope with sales increase
- 30. An account of the creation of the formula of Shower Power
- 31. An account of buying the original OzKleen company
- 32. Description of Shower Power's international expansion
- 33. The reason of changing the packaging size of Shower Power
- 34. An example of some innovative ideas

Questions 35 - 38

Look at the following people and list of statements below. Match each person with the

correct statement

Write the correct letter A-E in boxes 8-11 on your answer sheet.

- 35. Grant Keamey
- 36. Tom Quinn
- 37. Peter Quinn
- 38. Belinda McDonnell

List of Statement

- A. Described his story of selling his product to a chain store
- B. Explained there was a shortage of money when sales suddenly increased
- C. Believe innovations need support to succeed
- D. Believes new products like Shower Power may incur risks
- E. Says business won't succeed with innovations

Questions 39 - 40

Choose the correct letter A, B, C or D.

Write your answers in boxes 12-13 on your answer sheet.

- 36. Tom Quinn changed the bottle size to 750ml to make Shower Power

- A. Easier to package.
- B. Appealing to individual customers.
- C. Popular in foreign markets.
- D. Attractive to supermarkets.

36 Why did Tom Quinn decide not to sell OzKleen?

- A. No one wanted to buy OzKleen.
- B. New products were being developed in OzKleen.
- C. He couldn't make an agreement on the price with the buyer.
- D. He wanted to keep things unchanged.

Reading Test 34

SECTION 1

Coastal Archaeology of Britain

A The recognition of the wealth and diversity of England's coastal archaeology has been one of the most important developments of recent years. Some elements of this enormous resource have long been known. The so-called 'submerged forests' off the coasts of England, sometimes with clear evidence of human activity, had attracted the interest of antiquarians since at least the eighteenth century but serious and systematic attention has been given to the archaeological potential of the coast only since the early 1980s.

B It is possible to trace a variety of causes for this concentration of effort and interest. In the 1980s and 1990s scientific research into climate change and its environmental impact spilled over into a much broader public debate as awareness of these issues grew; the prospect of rising sea levels over the next century, and their impact on current coastal environments, has been a particular focus for concern. At the same time archaeologists were beginning to recognize that the destruction caused by natural processes of coastal erosion and by human activity was having an increasing impact on the archaeological resource of the coast.

C The dominant process affecting the physical form of England in the post-glacial period has been the rise in the altitude of sea level relative to the land, as the glaciers melted and the landmass readjusted. The encroachment of the sea, the loss of huge areas of land now under the North Sea and the English Channel, and especially the loss of the land bridge between England and France, which finally made Britain an island, must have been immensely significant factors in the lives of our prehistoric ancestors. Yet the way in which prehistoric communities adjusted to these environmental changes has seldom been a major theme in discussions of the period. One factor contributing to this has been that, although the rise in relative sea level is

comparatively well documented, we know little about the constant reconfiguration of the coastline. This was affected by many processes, mostly quiet, which have not yet been adequately researched. The detailed reconstruction of coastline histories and the changing environments available for human use will be an important theme for future research.

D So great has been the rise in sea level and the consequent regression of the coast that much of the archaeological evidence now exposed in the coastal zone, whether being eroded or exposed as a buried land surface, is derived from what was originally terrestrial occupation. Its current location in the coastal zone is the product of later unrelated processes, and it can tell us little about past adaptations to the sea. Estimates of its significance will need to be made in the context of other related evidence from dry land sites. Nevertheless, its physical environment means that preservation is often excellent, for example in the case of the Neolithic structure excavated at the Stumble in Essex.

E In some cases these buried land surfaces do contain evidence for human exploitation of what was a coastal environment, and elsewhere along the modern coast there is similar evidence. Where the evidence does relate to past human exploitation of the resources and the opportunities offered by the sea and the coast, it is both diverse and as yet little understood. We are not yet in a position to make even preliminary estimates of answers to such fundamental questions as the extent to which the sea and the coast affected human life in the past, what percentage of the population at any time lived within reach of the sea, or whether human settlements in coastal environments showed a distinct character from those inland.

F The most striking evidence for use of the sea is in the form of boats, yet we still have much to learn about their production and use. Most of the known wrecks around our coast are not unexpectedly of post-medieval date, and offer an unparalleled opportunity for research which has as yet been little used. The prehistoric sewn-plank boats such as those from the Humber estuary and Dover all seem to belong to the second millennium BC; after this there is a gap in the record of a millennium, which cannot yet be explained, before boats reappear, but built using a very different technology.

Boatbuilding must have been an extremely important activity around much of our coast, yet we know almost nothing about it. Boats were some of the most complex artefacts produced by pre-modern societies, and further research on their production and use make an important contribution to our understanding of past attitudes to technology and technological change.

G Boats needed landing places, yet here again our knowledge is very patchy. In many cases the natural shores and beaches would have sufficed, leaving little or no archaeological trace, but especially in later periods, many ports and harbors, as well as smaller facilities such as quays, wharves, and jetties, were built. Despite a growth of interest in the waterfront archaeology of some of our more important Roman and medieval towns, very little attention has been paid to the multitude of smaller landing places. Redevelopment of harbor sites and other development and natural pressures along the coast are subjecting these important locations to unprecedented threats, yet few surveys of such sites have been undertaken.

H One of the most important revelations of recent research has been the extent of industrial activity along the coast. Fishing and salt production are among the better documented activities, but even here our knowledge is patchy. Many forms of fishing will leave little archaeological trace, and one of the surprises of recent survey has been the extent of past investment in facilities for procuring fish and shellfish. Elaborate wooden fish weirs, often of considerable extent and responsive to aerial photography in shallow water, have been identified in areas such as Essex and the Severn estuary. The production of salt, especially in the late Iron Age and early Roman periods, has been recognized for some time, especially in the Thames estuary and around the Solent and Poole Harbor, but the reasons for the decline of that industry and the nature of later coastal salt working are much less well understood. Other industries were also located along the coast, either because the raw materials outcropped there or for ease of working and transport: mineral resources such as sand, gravel, stone, coal, ironstone, and alum were all exploited. These industries are poorly documented, but their remains are sometimes extensive and striking.

I Some appreciation of the variety and importance of the archaeological remains

preserved in the coastal zone, albeit only in preliminary form, can thus be gained from recent work, but the complexity of the problem of managing that resource is also being realised. The problem arises not only from the scale and variety of the archaeological remains, but also from two other sources: the very varied natural and human threats to the resource, and the complex web of organisations with authority over, or interests in, the coastal zone. Human threats include the redevelopment of historic towns and old dockland areas, and the increased importance of the coast for the leisure and tourism industries, resulting in pressure for the increased provision of facilities such as marinas. The larger size of ferries has also caused an increase in the damage caused by their wash to fragile deposits in the intertidal zone. The most significant natural threat is the predicted rise in sea level over the next century especially in the south and east of England. Its impact on archaeology is not easy to predict, and though it is likely to be highly localised, it will be at a scale much larger than that of most archaeological sites. Thus protecting one site may simply result in transposing the threat to a point further along the coast. The management of the archaeological remains will have to be considered in a much longer time scale and a much wider geographical scale than is common in the case of dry land sites, and this will pose a serious challenge for archaeologists.

Questions 1-3

Choose the correct letter, A, B, C or D.

Write your answers in boxes 1-3 on your answer sheet.

1. What has caused public interest in coastal archaeology in recent years?

- A. Golds and jewelleries in the ships that have submerged
- B. The rising awareness of climate change
- C. Forests under the sea
- D. Technological advance in the field of sea research

2. What does the passage say about the evidence of boats?

- A. We have a good knowledge of how boats were made and what boats were for

prehistorically

- B. Most of the boats discovered were found in harbors
- C. The use of boats had not been recorded for a thousand years
- D. The way to build boats has remained unchanged throughout human history

3. What can be discovered from the air?

- A. Salt mines
- B. Shellfish
- C. Ironstones
- D. Fisheries

Questions 4-10

Do the following statements agree with the information given in Reading Passage 1?

In boxes 4-10 on your answer sheet, write

TRUE	if the statement is true
FALSE	if the statement is false
NOT GIVEN	if the information is not given in the passage

- 4. England lost much of its land after the ice-age due to the rising sea level.
- 5. The coastline of England has changed periodically.
- 6. Coastal archaeological evidence may be well-protected by sea water.
- 7. The design of boats used by pre-modern people was very simple.
- 8. Similar boats were also discovered in many other European countries
- 9. There are few documents relating to mineral exploitation.
- 10. Large passenger boats are causing increasing damage to the seashore.

Questions 11-13

Choose THREE letters J-G Write your answer in boxes 11-13 on your answer sheet

Which THREE of the following statements are mentioned in the passage?

- A. Our prehistoric ancestors adjusted to the environmental change caused by the rising sea level by moving to higher lands
- B. It is difficult to understand how many people lived close to the sea.
- C. Human settlements in coastal environment were different from those inland.
- D. Our knowledge of boat evidence is limited.
- E. The prehistoric boats were built mainly for collecting sand from the river.

- F. Human development threatens the archaeological remains.
- G. The reason for the decline of salt industry was the shortage of laborers.

SECTION 2

Activities for Children

A Twenty-five years ago, children in London walked to school and played in parks and playing fields after school and at the weekend. Today they are usually driven to school by parents anxious about safety and spend hours glued to television screens or computer games. Meanwhile, community playing fields are being sold off to property developers at an alarming rate. 'This change in lifestyle has, sadly, meant greater restrictions on children,' says Neil Armstrong, Professor of Health and Exercise Sciences at the University of Exeter. 'If children continue to be this inactive, they'll be storing up big problems for the future.'

B In 1985, Professor Armstrong headed a five-year research project into children's fitness. The results, published in 1990, were alarming. The survey, which monitored 700 11-16-year-olds, found that 48 per cent of girls and 41 per cent of boys already exceeded safe cholesterol levels set for children by the American Heart Foundation. Armstrong adds, "heart is a muscle and need exercise, or it loses its strength." It also found that 13 per cent of boys and 10 per cent of girls were overweight. More disturbingly, the survey found that over a four-day period, half the girls and one-third of the boys did less exercise than the equivalent of a brisk 10-minute walk. High levels of cholesterol, excess body fat and inactivity are believed to increase the risk of coronary heart disease.

C Physical education is under pressure in the UK – most schools devote little more than 100 minutes a week to it in curriculum time, which is less than many other European countries. Three European countries are giving children a head start in PE, France, Austria and Switzerland - offer at least two hours in primary and secondary schools. These findings, from the European Union of Physical Education Associations, prompted specialists in children's physiology to call on European governments to give youngsters a daily PE programme. The survey shows that the UK ranks 13th out of the

25 countries, with Ireland bottom, averaging under an hour a week for PE. From age six to 18, British children received, on average, 106 minutes of PE a week. Professor Armstrong, who presented the findings at the meeting, noted that since the introduction of the national curriculum there had been a marked fall in the time devoted to PE in UK schools, with only a minority of pupils getting two hours a week.

D As a former junior football international, Professor Armstrong is a passionate advocate for sport. Although the Government has poured millions into beefing up sport in the community, there is less commitment to it as part of the crammed school curriculum. This means that many children never acquire the necessary skills to thrive in team games. If they are no good at them, they lose interest and establish an inactive pattern of behaviour. When this is coupled with a poor diet, it will lead inevitably to weight gain. Seventy per cent of British children give up all sport when they leave school, compared with only 20 per cent of French teenagers. Professor Armstrong believes that there is far too great an emphasis on team games at school. "We need to look at the time devoted to PE and balance it between individual and pair activities, such as aerobics and badminton, as well as team sports." He added that children need to have the opportunity to take part in a wide variety of individual, partner and team sports.

E The good news, however, is that a few small companies and children's activity groups have reacted positively and creatively to the problem. Take That, shouts Gloria Thomas, striking a disco pose astride her mini-spacehopper. Take That, echo a flock of toddlers, adopting outrageous postures astride their space hoppers. 'Michael Jackson, she shouts, and they all do a spoof fan-crazed shriek. During the wild and chaotic hopper race across the studio floor, commands like this are issued and responded to with untrammelled glee. The sight of 15 bouncing seven-year-olds who seem about to launch into orbit at every bounce brings tears to the eyes. Uncoordinated, loud, excited and emotional, children provide raw comedy.

F Any cardiovascular exercise is a good option, and it doesn't necessarily have to be high intensity. It can be anything that gets your heart rate up: such as walking the dog,

swimming, miming, skipping, hiking. "Even walking through the grocery store can be exercise," Samis-Smith said. What they don't know is that they're at a Fit Kids class, and that the fun is a disguise for the serious exercise plan they're covertly being taken through. Fit Kids trains parents to run fitness classes for children. 'Ninety per cent of children don't like team sports,' says company director, Gillian Gale.

G A prevention survey found that children whose parents keep in shape are much more likely to have healthy body weights themselves. "There's nothing worse than telling a child what he needs to do and not doing it yourself," says Elizabeth Ward, R.D., a Boston nutritional consultant and author of *Healthy Foods, Healthy Kids*. "Set a good example and get your nutritional house in order first." In the 1930s and '40s, kids expended 800 calories a day just walking, carrying water, and doing other chores, notes Fima Lifshitz, M.D., a pediatric endocrinologist in Santa Barbara. "Now, kids in obese families are expending only 200 calories a day in physical activity," says Lifshitz, "incorporate more movement in your family's lifepark farther away from the stores at the mall, take stairs instead of the elevator, and walk to nearby friends' houses instead of driving."

Questions 14 -17

The reading Passage has seven paragraphs A-G. Which paragraph contains the following information?

Write the correct letter A-G, in boxes 14-17 on your answer sheet.

14. Health and living condition of children
15. Health organization monitored physical activity
16. Comparison of exercise time between UK and other countries
17. Wrong approach for school activity

Questions 18-21

Do the following statements agree with the information given in Reading Passage 2?
In boxes 18-21 on your answer sheet, write

TRUE	if the statement is true
FALSE	if the statement is false
NOT GIVEN	if the information is not given in the passage

18. According to American Heart Foundation, cholesterol levels of boys are higher than girls'.

19. British children generally do less exercise than some other European countries.

20. Skipping becomes more and more popular in schools of UK.

21. According to Healthy Kids, the first task is for parents to encourage their children to keep the same healthy body weight.

Questions 22-26

Choose the correct letter, A, B, C or D.

Write your answers in boxes 22-26 on your answer sheet.

22. According to paragraph A, what does Professor Neil Armstrong concern about?

- A. Spending more time on TV affect academic level
- B. Parents have less time stay with their children
- C. Future health of British children
- D. Increasing speed of property's development

23. What does Armstrong indicate in Paragraph B?

- A. We need to take a 10 minute walk everyday
- B. We should do more activity to exercise heart
- C. Girls' situation is better than boys
- D. Exercise can cure many disease

24. What is aim of First Kids' training?

- A. Make profit by running several sessions
- B. Only concentrate on one activity for each child
- C. To guide parents how to organize activities for children
- D. Spread the idea that team sport is better

25. What did Lifshitz suggest in the end of this passage?

- A. Create opportunities to exercise your body
- B. Taking elevator saves your time
- C. Kids should spend more than 200 calories each day
- D. We should never drive but walk

26. What is main idea of this passage?

- A. health of the children who are overweight is at risk in the future
- B. Children in UK need proper exercises
- C. Government mistaken approach for children
- D. Parents play the most important role in children's activity

SECTION 3

You should spend about 20 minutes on Questions 27-40, which are based on Reading Passage 3 on the following pages.

Mechanisms of Linguistic Change

A The changes that have caused the most disagreement are those in pronunciation. We have various sources of evidence for the pronunciations of earlier times, such as the spellings, the treatment of words borrowed from other languages or borrowed by them, the descriptions of contemporary grammarians and spelling-reformers, and the modern pronunciations in all the languages and dialects concerned. From the middle of the sixteenth century, there are in England writers who attempt to describe the position of the speech-organs for the production of English phonemes, and who invent what are in effect systems of phonetic symbols. These various kinds of evidence, combined with a knowledge of the mechanisms of speech-production, can often give us a very good idea of the pronunciation of an earlier age, though absolute certainty is never possible.

B When we study the pronunciation of a language over any period of a few generations or more, we find there are always large-scale regularities in the changes: for example, over a certain period of time, just about all the long [a:] vowels in a language may change into long [e:] vowels, or all the [b] consonants in a certain position (for example at the end of a word) may change into [p] consonants. Such regular changes are often called sound laws. There are no universal sound laws (even though sound laws often reflect universal tendencies), but simply particular sound laws for one given language (or dialect) at one given period.

C It is also possible that fashion plays a part in the process of change. It certainly plays a part in the spread of change: one person imitates another, and people with the most prestige are most likely to be imitated, so that a change that takes place in one social group may be imitated (more or less accurately) by speakers in another group. When a social group goes up or down in the world, its pronunciation of Russian, which had

formerly been considered desirable, became on the contrary an undesirable kind of accent to have, so that people tried to disguise it. Some of the changes in accepted English pronunciation in the seventeenth and eighteenth centuries have been shown to consist in the replacement of one style of pronunciation by another style already existing, and it is likely that such substitutions were a result of the great social changes of the period: the increased power and wealth of the middle classes, and their steady infiltration upwards into the ranks of the landed gentry, probably carried elements of middle-class pronunciation into upper-class speech.

D A less specific variant of the argument is that the imitation of children is imperfect: they copy their parents' speech, but never reproduce it exactly. This is true, but it is also true that such deviations from adult speech are usually corrected in later childhood. Perhaps it is more significant that even adults show a certain amount of random variation in their pronunciation of a given phoneme, even if the phonetic context is kept unchanged. This, however, cannot explain changes in pronunciation unless it can be shown that there is some systematic trend in the failures of imitation: if they are merely random deviations they will cancel one another out and there will be no net change in the language.

E One such force which is often invoked is the principle of ease, or minimization of effort. The change from fussy to fuzzy would be an example of assimilation, which is a very common kind of change. Assimilation is the changing of a sound under the influence of a neighbouring one. For example, the word *scant* was once *skamt*, but the /m/ has been changed to /n/ under the influence of the following /t/. Greater efficiency has hereby been achieved, because /n/ and /t/ are articulated in the same place (with the tip of the tongue against the teeth-ridge), whereas /m/ is articulated elsewhere (with the two lips). So the place of articulation of the nasal consonant has been changed to conform with that of the following plosive. A more recent example of the same kind of thing is the common pronunciation of *football* as *football*.

F Assimilation is not the only way in which we change our pronunciation in order to increase efficiency. It is very common for consonants to be lost at the end of a word: in Middle English, word-final [-n] was often lost in unstressed syllables, so that *baken* 'to

bake' changed from ['ba:kan] to ['ba:k3],and later to [ba:k]. Consonant-clusters are often simplified. At one time there was a [t] in words like castle and Christmas, and an initial [k] in words like knight and know. Sometimes a whole syllable is dropped out when two successive syllables begin with the same consonant (haplology): a recent example is temporary, which in Britain is often pronounced as if it were temporary.

Questions 27-30

Complete the summary below.

Choose **NO MORE THAN THREE WORDS** from the passage for each answer. Write your answers in boxes 27-30 on your answer sheet.

The pronunciation of living language undergo changes throughout thousands of years. Large scale regular changes are usually called 27_____. There are three reasons for these changes. Firstly, the influence of one language on another; when one person imitates another pronunciation (the most prestige's), the imitation always partly involving factor of 28_____. Secondly, the imitation of children from adults¹ language sometimes are 29_____, and may also contribute to this change if there are insignificant deviations tough later they may be corrected Finally, for those random variations in pronunciation, the deeper evidence lies in the 30_____or minimization of effort.

Questions 31-37

Do the following statements agree with the information given in Reading Passage 3? In boxes 31-37 on your answer sheet, write

TRUE	if the statement is true
FALSE	if the statement is false
NOT GIVEN	if the information is not given in the passage

31. it is impossible for modern people to find pronunciation of words in an earlier age

32. The great change of language in Russian history is related to the rising status and fortune of middle classes.
33. All the children learn speeches from adults while they assume that certain language is difficult to imitate exactly.
34. Pronunciation with causal inaccuracy will not exert big influence on language changes.
35. The link of can be influenced being pronounced as 'nf'
36. The [g] in gnat not being pronounced will not be spelt out in the future.
37. The sound of 'temporary' cannot wholly present its spelling.

Questions 38-40

Look at the following sentences and the list of statements below. Match each statement with the correct sentence, A-D.

Write the correct letter, A-D, in boxes 38-40 on your answer sheet

- A. Since the speakers can pronounce it with less effort
- B. Assimilation of a sound under the influence of a neighbouring one
- C. It is a trend for changes in pronunciation in a large scale in a given period
- D. Because the speaker can pronounce [n] and [t] both in the same time

38. As a consequence, 'b' will be pronounced as

39. The pronunciation of [mt] changed to [nt]

40. The omit of 'f' in the sound of Christmas

Reading Test 35

SECTION 1

You should spend about 20 minutes on Questions 1 -14 which are based on Reading Passage 1 below.

A. Adults and children are frequently confronted with statements about the alarming rate of loss of tropical rainforests. For example, one graphic illustration to which children might readily relate is the estimate that rainforests are being destroyed at a rate equivalent to one thousand football fields every forty minutes — about the duration of a normal classroom period. In the face of the frequent and often vivid media coverage, it is likely that children will have formed ideas about rainforests - what and where they are, why they are important, what endangers them-independent of any formal tuition. It is also possible that some of these ideas will be mistaken.

B. Many studies have shown that children harbour misconceptions about 'pure', curriculum science. These misconceptions do not remain isolated but become incorporated into a multifaceted, but organized, conceptual framework, making it and the component ideas, some of which are erroneous, more robust but also accessible to modification. These ideas may be developed by children absorbing ideas through the popular media. Sometimes this information may be erroneous. It seems schools may not be providing an opportunity for children to re-express their ideas and so have them tested and refined by teachers and their peers.

C. Despite the extensive coverage in the popular media of the destruction of rainforests, little formal information is available about children's ideas in this area. The aim of the present study is to start to provide such information, to help teachers design their educational strategies to build upon correct ideas and to displace misconceptions and to plan programmes in environmental studies in their schools. The study surveys children's scientific knowledge and attitudes to rainforests. Secondary school children were asked to complete a questionnaire containing five open-form questions. The most frequent responses to the first question were descriptions which are self-evident from the term

'rainforest'. Some children described them as damp, wet or hot. The second question concerned the geographical location of rainforests. The commonest responses were continents or countries; Africa (given by 43% of children), South America (30%), Brazil (25%). Some children also gave more general locations, such as being near the Equator.

D. Responses to question three concerned the importance of rainforests. The dominant idea, raised by 64% of the pupils, was that rainforests provide animals with habitats. Fewer students responded that rainforests provide plant habitats, and even fewer mentioned the indigenous populations of rainforests. More girls (70%) than boys (60%) raised the idea of the rainforest as animal habitats. Similarly, but at a lower level, more girls (13%) than boys (5%) said that rainforests provided human habitats. These observations are generally consistent with our previous studies of pupils' views about the use and conservation of rainforests, in which girls were shown to be more sympathetic to animals and expressed views which seem to place an intrinsic value on non-human animal life.

E. The fourth question concerned the causes of the destruction of rainforests. Perhaps encouragingly, more than half of the pupils (59%) identified that it is human activities which are destroying rainforests, some personalizing the responsibility by the use of terms such as 'we are'. About 18% of the pupils referred specifically to logging activity. One misconception, expressed by some 10% of the pupils, was that acid rain is responsible for rainforest destruction; a similar proportion said that pollution is destroying rainforests. Here, children are confusing rainforest destruction with damage to the forests of Western Europe by these factors. While two fifths of the students provided the information that the rainforests provide oxygen, in some cases this response also embraced the misconception that rainforest destruction would reduce atmospheric oxygen, making the atmosphere incompatible with human life on Earth.

F. In answer to the final question about the importance of rainforest conservation, the majority of children simply said that we need rainforests to survive. Only a few of the pupils (6%) mentioned that rainforest destruction may contribute to global warming. This is surprising considering the high level of media coverage on this issue. Some children

expressed the idea that the conservation of rainforests is not important. The results of this study suggest that certain ideas predominate in the thinking of children about rainforests. Pupils' responses indicate some misconceptions in basic scientific knowledge of rainforests' ecosystems such as their ideas about rainforests as habitats for animals, plants and humans and the relationship between climatic change and destruction of rainforests.

G. Pupils did not volunteer ideas that suggested that they appreciated the complexity of causes of rainforest destruction. In other words, they gave no indication of an appreciation of either the range of ways in which rainforests are important or the complex social, economic and political factors which drive the activities which are destroying the rainforests. One encouragement is that the results of similar studies about other environmental issues suggest that older children seem to acquire the ability to appreciate, value and evaluate conflicting views. Environmental education offers an arena in which these skills can be developed, which is essential for these children as future decision-makers.

Questions 1 -8

Do the following statements agree with the information given in Reading Passage 1? In boxes 1 -8 on your answer sheet write,

TRUE, if the statement agrees with the information

FALSE, if the statement contradicts the information

NOT GIVEN, if there is no information on this

1. The plight of the rainforests has largely been ignored by the media.
2. Children only accept opinions on rainforests that they encounter in their classrooms.
3. It has been suggested that children hold their study at school.
4. The fact that children's ideas about science form part of a larger framework of ideas means that it is easier to change them.
5. The study involved asking children a number of yes/no questions such as 'Are there any rainforests in Africa?'
6. Girls are more likely than boys to hold mistaken views about the rainforests' destruction.
7. The study reported here follows on from a series of studies that have looked at children's understanding of rainforests.

8. A second study has been planned to investigate primary school children's ideas about rainforests.

Questions 9 -13

The box below gives a list of responses A-P to the questionnaire discussed in Reading Passage 1.

Answer the following questions by choosing the correct responses A-P.

9. What was the children's most frequent response when asked where the rainforests were?

10. What was the most common response to the question about the importance of the rainforests?

11. What did most children give as the reason for the loss of the rainforests?

12. Why did most children think it important for the rainforests to be protected?

13. Which of the responses is cited as unexpectedly uncommon, given the amount of time spent on the issue by the newspapers and television?

A. There is a complicated combination of reasons for the loss of the rainforests.

B. The rainforests are being destroyed by the same things that are destroying the forests of Western Europe.

C. Rainforests are located near the Equator.

D. Brazil is home to the rainforests.

E. Without rainforests, some animals would have nowhere to live.

F. Rainforests are important habitats for a lot of plants.

G. People are responsible for the loss of the rainforests.

H. The rainforests are a source of oxygen.

I. Rainforests are of consequence for a number of different reasons.

J. As the rainforests are destroyed, the world gets warmer.

K. Without rainforests there would not be enough oxygen in the air.

L. There are people for whom the rainforests are home.

M. Rainforests are found in Africa.

N. Rainforests are not really important to human life.

O. The destruction of the rainforests is the direct of logging activity.

P. Humans depend on the rainforests for their continuing existence.

Question 14

Choose the correct letter, A, B, C, D or E. Write your answer in box 14 on your answer sheet. Which of the following is the most suitable title for the Reading Passage.

A. The development of a programme in environmental studies within a science curriculum.

B. Children's ideas about the rainforests and the implications for course design.

C. The extent to which children have been misled by the media concerning the rainforests.

- D. How to collect, collate and describe the ideas of secondary school children.
- E. The importance of the rainforests and the reason for their destruction.

SECTION 2

You should spend about 20 minutes on Questions 15 -26 which are based on Reading Passage 2 below.

WHAT DO WHALES FEEL?

A. An examination of the functioning of the senses in cetaceans, the group of mammals comprising whales, dolphins and porpoises. Some of the senses that we and other terrestrial mammals take for granted are either reduced or absent in cetaceans or fail to function well in water. For example, it appears from their brain structure species, on the other hand, appears to have some related brain structures but it is not known whether these are functional. It has been speculated that, as the blowholes evolved and migrated to the top of the head, the neural pathways serving sense of smell may have been nearly all sacrificed. Similarly, although at least some cetaceans have taste buds, the nerves serving these have degenerated or are rudimentary.

B. The sense of touch has sometimes been described as weak too, but this view is probably mistaken. Trainers of captive dolphins and small whales often remark on their animals' responsiveness to being touched or rubbed, and both captive and free-ranging cetacean individuals of all species (particularly adults and calves, or members of the same subgroup) appear to make frequent contact. This contact may help to maintain order within a group, and stroking or touching is part of the courtship ritual in most species. The area around the blowhole is also particularly sensitive and captive animals often object strongly to being touched there. The sense of vision is developed to different degrees in different species. Baleen species studied at close quarters underwater specifically a grey whale calf in captivity for a year, and free-ranging right whales and humpback whales studied and filmed off Argentina and Hawaii-have obviously tracked objects with vision underwater, and they can apparently see moderately well both in water and in air. However, the position of the eyes so restricts the field of vision in baleen whales that they probably do not have stereoscopic vision.

C. On the other hand, the position of the eyes in most dolphins and porpoises suggests that they have stereoscopic vision forward and downward. Eye position in freshwater dolphins, which often swim on their side or upside down while feeding, suggests that what vision they have is stereoscopic forward and upward. By comparison, the bottlenose dolphin has an extremely keen vision in water. Judging from the way it watches and tracks airborne flying fish, it can apparently see fairly well through the air-water interface as well. And although preliminary experimental evidence suggests that their in-air vision is poor, the accuracy with which dolphins leap high to take small fish out of a trainer's hand provides anecdotal evidence to the contrary.

D. Such variation can no doubt be explained with reference to the habitats in which individual species have developed. For example, vision is obviously more useful to species inhabiting clear open waters than to those living in turbid rivers and flooded plains. The South American manatee and Chinese manatee, for instance, appear to have very limited vision, and the Indian manatee is blind, their eyes reduced to slits that probably allow them to sense only the direction and intensity of light. Although the senses of taste and smell appear to have deteriorated and vision in water appears to be uncertain, such weaknesses are more than compensated for by cetaceans' well-developed acoustic sense. Most species are highly vocal, although they vary in the range of sounds they produce, and many forage for food using echolocation. Large baleen whales primarily use the lower frequencies and whales primarily use the lower frequencies and are often limited in their repertoire.

E. Notable exceptions are the nearly song-like choruses of bow-head whales in summer and the complex, haunting utterances of the humpback whales. Toothed species, in general, employ more of the frequency spectrum, and produce a wider variety of sounds, than baleen species (though the sperm whale apparently produces a monotonous series of high-energy clicks and little else). Some of the more complicated sounds are clearly communicative, although what role they may play in the social life and 'culture' of cetaceans has been more the subject of wild speculation than of solid science.

Questions 15 -21

Choose NO MORE THAN THREE WORDS from Reading Passage 2 for each answer. Write your answers in boxes 15 -21 on your answer sheet.

Complete the table below.

SENSE	SPECIES	ABILITY	COMMENTS
	toothed	No	evidence from brain structure
Smell	baleen	Not certain	Related brain structures are present
Taste	Some types	Poor	nerves linked to their ____15____ are underdeveloped
Touch	all	Yes	region around the blowhole very sensitive
	____16____	Yes	probably do not have stereoscopic vision
	dolphins, porpoises	Yes	probably have stereoscopic vision 17____ and _____

Vision	_____18_____	Yes	probably have stereoscopic vision forward and upward
	bottle nose dolphin	Yes	exceptional in _____19_____ and good in air-water interface
	boutu and beiji	Poor	have limited vision
	Indian susu	No	probably only sense direction and intensity of light
	most large baleen	Yes	Usually use _____20_____; repertoire limited
	21_____		
Hearing	whales and _____ whales	Yes	song-like
	Toothed	Yes	use more of frequency spectrum; have wider repertoire

Questions 22 -26

Answer the questions below using NO MORE THAN THREE WORDS from the passage for each answer. Write your answers in boxes 22 -26 on your answer sheet.

22. Which of the senses is described here as being involved in mating?
23. Which species swims upside down while eating?
24. What can bottlenose dolphins follow from under the water?
25. Which type of habitat is related to good visual ability?
26. Which of the senses is best developed in cetaceans?

SECTION 3

You should spend about 20 minutes on Questions 27 -40 which are based on Reading Passage 3 below.

VISUAL SYMBOLS AND THE BLIND

Part 1

A. From a number of recent studies, it has become clear that blind people can appreciate the use of outlines and perspectives to describe the arrangement of objects and other surfaces in space. But pictures are more than literal representations. This fact was drawn to my attention dramatically when a blind woman in one of my investigations decided on her own initiative to draw a wheel as it was spinning. To show this motion she traced a curve inside the show this motion, she traced a curve inside the circle. I was taken aback. Lines of motion, such as the one she used, are a very recent invention in the history of illustration. Indeed, as art scholar David Kunzle notes, Wilhelm Busch, a trend-setting nineteenth-century cartoonist, used virtually no motion lines in his popular figures until about 1877.

B. When I asked several other blind study subjects to draw a spinning wheel, one particularly clever rendition appeared repeatedly: several subjects showed the wheel's spokes as curved lines. When asked about these curves, they all described them as metaphorical ways of suggesting motion. Majority rule would argue that this device somehow indicated motion very well. But was it a better indicator than, say, broken or wavy lines or any other kind of line, for that matter? The answer was not clear. So I decided to test whether various lines of motion were apt ways of showing movement they were merely idiosyncratic marks. Moreover, I wanted to discover whether there were differences in how the blind and the sighted interpreted lines of motion.

C. To search out these answers, I created raised line drawings of five different wheels, depicting spokes with lines that curved, bent, waved, dashed and extended beyond the perimeter of the wheel. I then asked eighteen blind volunteers to feel the wheels and assign one of the following motions to each wheel: wobbling, spinning fast, spinning steadily, jerking or braking. My control group consisted of eighteen sighted

undergraduates from the University of Toronto. All but one of the blind subjects assigned distinctive motions to each wheel. Most guessed that the curved spokes indicated that the wheel was spinning steadily; the wavy spokes, they thought, suggested that the wheel was wobbling; and the bent spokes were taken as a sign that the wheel was jerking. Subjects assumed that spokes extending beyond the wheel's perimeter signified that the wheel had its brakes on and that dashed spokes indicated the wheel was spinning quickly.

D. In addition, the favoured description for the sighted was the favoured description for the blind in every instance. What is more, the consensus among the sighted was barely higher than that among the blind. Because motion devices are unfamiliar to the blind, the task I gave them involved some problem-solving. Evidently, however, the blind not only figured out meanings for each line of motion but as a group they generally came up with the same meaning at least as frequently as did sighted subjects.

Part 2.

E. We have found that the blind understand other kinds of visual metaphors as well. One blind woman drew a picture of a child inside a heart choosing that symbol, she said, to show that love surrounded the child. With Chang Hong Liu, a doctoral student from China, I have begun exploring how well blind people understand the symbolism behind shapes such as hearts that do not directly represent their meaning. We gave a list of twenty pairs of words to sighted subjects and asked them to pick from each pair the term that best related to a circle and the term that best related to a square. For example, we asked; What goes with soft? A circle or a square? Which shape goes with hard?

F. All our subjects deemed the circle soft and the square hard. A full 94% described happy to the circle, instead of sad. But other pairs revealed less agreement; 79% matched fast to slow and weak to strong, respectively. And only 51% linked deep to circle and shallow to the square. When we tested four totally blind volunteers using the same list, we found that their choices closely resembled those made by the sighted subjects. One man, who had been blind since birth, scored extremely well. He made only one match differing from the consensus, assigning 'far' to square and 'near' to circle. In fact,

only a small majority of sighted subjects — 53% — had paired far and near to the opposite partners. Thus, we concluded that the blind interpret abstract shapes as sighted people do.

G. List of twenty pairs of words to sighted subjects and asked them to pick from each pair the term that best related to a circle and the term that best related to a square. For example, we asked; What goes with soft? A circle or a square? Which shape goes with hard?

Words associated with circle/square	Agreement among subjects (%)
SOFT-HARD	100
MOTHER-FATHER	94
HAPPY-SAD	94
GOOD-EVIL	89
LOVE-HATE	89
ALIVE-DEAD	87
BRIGHT-DARK	87
LIGHT-HEAVY	85
WARM-COLD	81
SUMMER-WINTER	81
WEAK-STRONG	79
FAST-SLOW	97
CAT-DOG	74
SPRING-FALL	74
QUIET-LOUD	62

WALKING-STANDING	62
ODD-EVEN	57
FAR-NEAR	53
PLANT-ANIMAL	53
DEEP-SHALLOW	51

Subjects were asked which word in each pair fits best with a circle and which with a square. These percentages show the level of consensus among sighted subjects.

Questions 27 -29

Choose the correct letter, A, B, C or D. Write your answers in boxes 27-29 on your answer sheet.

27. In the first paragraph, the writer makes the point that blind people

- A. may be interested in studying art.
- B. can draw outlines of different objects and surfaces
- C. can recognize conventions such as perspective.
- D. can draw accurately.

28. The writer was surprised because the blind woman

- A. drew a circle on her own initiative.
- B. did not understand what a wheel looked like.
- C. included a symbol representing movement.
- D. was the first person to use lines of motion.

29. From the experiment described in Part 1, the writer found that the blind subjects

- A. had a good understanding of symbols representing movement.
- B. could control the movement of wheels very accurately.
- C. worked together well as a group in solving problems.
- D. got better results than the sighted undergraduates.

Questions 30 -32

Look at the following diagrams (Questions 30 - 32), and the list of types of movement below. Match each diagram to the type of movement AE generally assigned to it in the experiment. Choose the correct letter A-E and write them in boxes 30 -32 on your answer sheet.

- A. steady spinning
- B. jerky movement
- C. rapid spinning
- D. wobbling movement
- E. use of brakes

Questions 33 —39

Complete the summary below using words from the box. Write your answers in boxes 33-39 on your answer sheet. NB you may use any word more than once.

In the experiment described in Part 2, a set of word_33_was used to investigate whether blind and sighted people perceived the symbolism in abstract__34__in the same way. Subjects were asked which word fitted best with a circle and which with a square. From the__35__ volunteers, everyone thought a circle fitted 'soft' while a square fitted 'hard';. However, only 51% of the_36_volunteers assigned a circle to __37__When the test was later repeated with__38__volunteers, it was found that they made_39_choices.

associations	blind	deep	hard
hundred	identical	pairs	shapes
sighted	similar	shallow	soft
words			

Question 40

Choose the correct letter, A, B, C or D. Write your answer in box 40 on your answer sheet.

40. Which of the following statements best summarizes the writer's general conclusion?
- A. The blind represent some aspects of reality differently from sighted people.
 - B. The blind comprehend visual metaphors in similar ways to sighted people.
 - C. The blind may create unusual and effective symbols to represent reality.
 - D. The blind may be successful artists if given the right training.

4	F	5	A	6	D
7	C	8	E	3	B
10	C	11	NOT GIVEN	12	FALSE
13	TRUE				
14	B	15	H	16	C
17	A	18	G	19	Cargo vessel
20	Luxury items	21	Gearwheel	22	Analog computer
23	C	24	B	25	B
26	A				
27	v	28	X	29	lii
30	i	31	vii	32	viii
33	ii	34	C	35	B
36	E	37	A	38	D
39	C	40	D		

Reading Test 30

1	B	2	B	3	D
4	D	5	B	6	ferry
7	Bicycle	8	Fan/ceiling fan	9	Air conditioner
10	Mosquitos/ mosquito	11	A	12	C
13	E				
14	NOT GIVEN	15	FALSE	16	TRUE
17	FALSE	18	FALSE	19	F
20	B	21	G	22	C
23	H	24	B	25	D
26	A				
27	vi	28	lv	29	ii
30	V	31	vii	32	F
33	B	34	E	35	D
36	G	37	A	38	C
39	B	40	C		

Reading Test 31

1	Spread	2	Rain/rainfall	3	Climate change
4	10 times	5	Primary Fuel	6	Fire Season
7	C	8	B	9	D
10	True	11	Not Given	12	True
13	False				
14	True	15	False	16	True
17	Not given	18	True	19	Not given
20	1976 and 1995	21	2000 floods	22	France
23	1956	24	1998 and 2002	25	1990
26	500	27	D		
28	False	29	True	30	True
31	Not given	32	False	33	Not given
34	True	35	History of childhood	35	(as) miniature adults
36	(with the) industrialization	37	The factory act	38	Play and education
40	Classroom				

Reading Test 32

1	NOT GIVEN	2	FALSE	3	NOT GIVEN
4	TRUE	5	Evergreen	6	Natural pesticides
7	Power	8	Overnight	9	Neem cake
10	Doubles	11	Nitrogen	12	2000
13	Neem seeds	14	Water purification		
15	Identical	16	Balls of paper	17	Count/ Calculate eggs
18	fruits flies	18	Mosquito fish	20	Surface area
21	sugar water	22	TRUE	23	FALSE
24	NOT GIVEN	25	TRUE	26	NOT GIVEN
27	TRUE				
28	F	29	I	30	C
31	B	32	G	33	C
34	B	35	A	36	YES
37	YES	38	NO	39	NOT GIVEN
40	NO				

Reading Test 33

1	D	2	B	3	C
4	A	5	YES	6	NO
7	NOT GIVEN	8	YES	3	NO
10	Farming	11	Curry	12	Natural/ organic
13	Chemical				
14	A	15	E	16	F
17	C	18	B	19	J
20	K	21	F	22	C
23	D	24	TRUE	25	FALSE
26	TRUE	27	NOT GIVEN		
28	F	29	E	30	C
31	B	32	G	33	D
34	A	35	C	36	A
37	D	38	B	39	B
40	D				

Reading Test 34

1	B	2	C	3	D
4	TRUE	5	FALSE	6	TRUE
7	FALSE	8	NOT GIVEN	9	TRUE
10	TRUE	11	B	12	D
13	F				
14	A	15	B	16	C
17	D	18	NOT GIVEN	19	TRUE
20	NOT GIVEN	21	FALSE	22	C
23	B	24	C	25	A
26	B	27	Sound laws		
28	Fashion	29	Imperfect	30	Principle
31	False	32	False	33	Not given
34	True	35	True	36	Not given
37	True	38	C	39	B
40	A				

Reading Test 35

1	FALSE	2	FALSE	3	TRUE
4	TRUE	5	FALSE	6	NOT GIVEN
7	TRUE	8	NOT GIVEN	9	M
